1916 Year Book
Copyright 1916, Western Electric Company, Incorporated
General Offices: 463 West St., New York City
V.R.

FOREWORD

The Western Electric 1915 Year Book with its uniform list price and discount plan was an innovation which met with such general favor by the trade that we follow the same plan in publishing this 1916 Year Book. By its use our customers are able to determine at a glance their approximate costs on any of the thousands of items of merchandise cataloged. We hope that you will find it of value, and that through it we may serve you to our mutual advantage.

In compiling this Year Book we have endeavored to include all standard electrical apparatus and supplies. Information and prices on special material not listed herein, you may secure from our traveling representative or by writing our nearest distributing house.

From time to time descriptive matter is issued covering new electrical material placed on the market. In addition descriptive literature is issued covering

POLES FAN MOTORS MOTORS AND GENERATORS ELECTRIC HOUSEHOLD DEVICES TELEPHONE APPARATUS ETC., ETC.

These may likewise be obtained on request. Most of the material listed in this catalog is carried in stock at our distributing houses, one of which is located within overnight reach of you.

We await an opportunity to serve your needs.

Western Electric Company
INCORPORATED

New York	Atlanta	Chicago	Kansas City	San Francisco	
Buffalo	Richmond	Milwaukee	Omaha	Oakland	
Newark	Savannah	Indianapolis	Oklahoma City	Los Angeles	
Philadelphia	New Orleans	Detroit	Minneapolis	Seattle	
Boston	Houston	Cleveland	St. Paul	Portland	
Pittsburgh	St. Louis	Cincinnati	Dallas	Denver	Salt Lake City

EQUIPMENT FOR EVERY ELECTRICAL NEED

Prices

Prices found in this catalog are revised to agree with the latest costs at the time of issue. It is to be understood that they are subject to change without notice and are therefore not offered by us as a quotation. It is contemplated that all prices are for shipment from our warehouse unless otherwise specified, except such goods as are shipped regularly direct from factories, in which cases prices are for factory delivery unless otherwise specifically agreed upon.

Orders

You will note that we have placed opposite each article, when possible, a list number. When ordering material by mail, kindly order by the list number and give a description of the article required.

You are requested to specify the routing over which you prefer shipments to be made. In the absence of specific instructions, we shall use our best judgment in selecting the route, but we are not responsible for extra drayage expenses at destination.

Terms

Our terms are 30 days net from date of invoice. Cash discount for payment within ten days from date of invoice may be deducted at the rates set forth in the manufacturers' schedules of cash discounts, or such cash discounts may be deducted for payment with order.

Payments may be made by check, bank draft, postal or express money order, drawn to the order of or endorsed to the order of the Western Electric Company.

Payment in currency through the mails is not recommended. Registered mail may be used at the sender's risk. We are not responsible for loss or miscarriage of the mails.

Receipts are not issued for remittances unless requested. Our endorsement on remittance is acknowledgment of the receipt of the funds.

We solicit new accounts on a credit basis, and in order to give prompt service, request that where you are not rated by the Commercial Agencies, references or other information of a credit character be forwarded with the order. These will be immediately acted upon, and the results held in strict confidence for our sole use and, when reasonably satisfactory, shipment will follow with all possible dispatch.

To avoid the delay incidental to communicating with references, etc., it would be mutually convenient, when immediate shipment is desired, to instruct us to ship C. O. D., by express, or parcel post (insured if so instructed) or by freight subject to sight draft through a local bank against bill of lading.

We shall advise you of the terms on future orders promptly after communications from references are received.

Returned Goods

To save you transportation charges, and to facilitate the handling of goods upon receipt, you are requested not to return goods without having obtained shipping instructions from us.

Shipments

As experienced packers are employed, and as reasonable care is used in packing, we cannot be held responsible for breakage in packages which are delivered in "good order" by the carrier.

Shipments of glassware are made at your risk.

Goods ordered to be shipped by parcel post will be sent only at the purchaser's risk of loss or damage.

Line Tools, Overhead	47-48	Wheels, Trolley	91-92

LINE MATERIAL

General

Sherardizing

Sherardizing is now generally recognized as the standard finish and protection for all iron and steel including the threaded portions used in the manufacture of line material devices. Marked improvement in the process of manufacture has been made over that used in the early stages of the art, which insures customers a uniform product of highly efficient protective qualities regardless of shape or dimension and part so treated. In this process zinc is deposited by baking upon the surface to be protected, the zinc entering the pores of the metal forming a very close union with the metal, the coating is then built up to desired thickness. There is no tendency to crack or scale off as in hot or electrolytic galvanizing; the zinc is deposited into and on the surface to be protected adhering to it as one.

Sherardizing withstands readily the Preece test of successive immersions in copper sulphate frequently used by large users of galvanized materials, but this test does not indicate the actual resisting qualities of the zinc coating to the atmospheric condition in which it is used. A comparative test of sherardized and galvanized materials having the same weight of zinc deposited per square inch, and withstanding about the same number of immersions in copper sulphate, will show when subjected to a life test under service conditions that the sherardized coating will last more than twice the length of time of the galvanized coating, a fact not shown by the Preece test. A test in which the sample is entirely apart from corrosive material and subjected continuously to the action of salt water atomized by an air jet will effectually determine the true value of the protective qualities of the coatings. The sherardizing withstands indefinitely the salt spray test, which actually represents many times the severest conditions encountered in service.

Sherardizing has the additional advantage of furnishing efficient protection of threaded and other exposed surfaces without materially altering their dimensions, whereas, in hot galvanizing, screw threads are apt to be recut and the steel surface is, therefore, liable to partial exposure. It is also free from the weakening effect caused by hot galvanizing on malleable iron in certain forms, which has to some extent limited the employment of galvanizing in line material manufacture, and has often seriously impaired the integrity of the surfaces of irregular sections.

Japanning

In mines where acids are found in the mine water sufficient in strength to cause a rapid deterioration of the coating, it is generally recommended that material having japanned finish be used, and that a coat of asphaltum paint be applied from time to time. The japanned devices have a coat of good standard air drying japan carefully applied.

Dimensions

In this catalog descriptions of the overhead line devices contain detail dimensions which, it is believed, will assist intending purchasers. It must be understood, however, that the dimensions given are averages and are therefore subject to reasonable variation in manufacture.

TROLLEY WIRE SUPPORTS

General

The trolley wires in and about mining and industrial properties are generally supported directly from the mine roof or roof timbers except where the height or unevenness of the roof makes it necessary to attach the suspension to a length of pipe fastened either in the roof or side wall. Outside of the mines and in yards various forms of rigid overhead supports are used to hold the trolley wire within the comparatively short reach of the trolley poles used on mining locomotives.

Application

When installing the trolley supports directly in the "top," care should be taken to drill the holes as near vertical as possible and reasonably accurate in diameter. The proper alignment of the support will materially increase the life of the trolley wire and improve the operation of the trolley wheels. The modern designs of suspensions are provided with large circular bearing surfaces in a plane above the boss which when tightened against the mine roof resist all side and longitudinal strains and maintain the suspension in a vertical position.

The elimination of the boss above the bearing surface makes the recovery of the expansion bolt possible.

The flat top suspension, combination pipe clamp and mechanical clamping ear are readily adapted to all forms of rigid overhead constructions ordinarily used on the surface about the mines.

The low combination suspension and mechanical clamping ear fastened directly into the roof with an expansion bolt gives a clearance of 4 inches between the trolley wire and roof and is especially recommended for use in mines having limited head-room.

POLE BRACKETS, FLEXIBLE

The following pole brackets represent the various forms called for in modern railway line construction and include the three styles of tube, the use of which has been approved in the best practice. The wrought iron pipe referred to in the table is standard welded gas and water pipe, and the structural tubing is a special high carbon steel tube with butt joint, which, because of the great stiffness of the material, does not require a welded seam. All diameters given are the nominal inside diameters of standard wrought iron pipe. All parts of these brackets are finished in black Japan.

The following table gives dimensions and weights of the various tubes employed.

Material	Nominal Inside Diam. in Ins.	Actual Outside Diam. in Ins.	Thickness of Wall in Ins.	Wt. in Lbs. per Ft.
Wrought iron pipe.....	$\left\{ \begin{array}{l} 1\frac{1}{4} \\ 1\frac{1}{2} \\ 2 \end{array} \right.$	$\left\{ \begin{array}{l} 1.66 \\ 1.90 \\ 2.375 \end{array} \right.$	$\left\{ \begin{array}{l} 0.140 \\ 0.145 \\ 0.154 \end{array} \right.$	$\left\{ \begin{array}{l} 2.2 \\ 2.6 \\ 3.6 \end{array} \right.$
"A" tubing.....	$\left\{ \begin{array}{l} 1\frac{1}{4} \\ 1\frac{1}{2} \\ 2 \end{array} \right.$	$\left\{ \begin{array}{l} 1.66 \\ 1.90 \\ 2.375 \end{array} \right.$	$\left\{ \begin{array}{l} 0.065 \\ 0.107 \\ 0.140 \end{array} \right.$	$\left\{ \begin{array}{l} 1.5 \\ 1.87 \\ 2.5 \end{array} \right.$
"C" tubing.....	$\left\{ \begin{array}{l} 1\frac{1}{4} \\ 1\frac{1}{2} \\ 2 \end{array} \right.$	$\left\{ \begin{array}{l} 1.66 \\ 1.90 \\ 2.375 \end{array} \right.$	$\left\{ \begin{array}{l} 0.140 \\ 0.145 \\ 0.154 \end{array} \right.$	$\left\{ \begin{array}{l} 2.2 \\ 2.5 \\ 3.5 \end{array} \right.$

Iron poles, such as are used in line construction, have actual outside diameters somewhat larger than their nominal listed diameters.

4 in. standard pipe pole, actual outside diam. 4 $\frac{1}{4}$ ins. 6 in. standard pipe pole, actual outside diam. 6 $\frac{1}{4}$ ins.
5 in. standard pipe pole, actual outside diam. 5 $\frac{1}{4}$ ins. 7 in. standard pipe pole, actual outside diam. 7 $\frac{1}{4}$ ins.

The brackets listed are furnished complete including tube, guy rod, set of castings, cable, eyebolts and lag screws for wood poles or pole clamps for iron pole construction.

Brackets with cable, eyebolts and lag screws omitted may be furnished when desired.

Suspension arm for Form H Curve Suspension. Has $\frac{1}{4}$ inch eye.

Straight Line, 600 Volt

Each of these suspensions, being in one piece is held against turning by the span wire, and cannot therefore, become unscrewed as a result of vibration in service. Special leather washers can be provided to permit adjustment in seating the car boss against the suspension. Overall length, 6 $\frac{1}{2}$ inches; arm yokes accommodate $\frac{3}{8}$ inch span wire.

TROLLEY WIRE SUPPORTS

Fig. 1

Low Combination Mining Suspension

Fig. 2

Low Combination Mining

This suspension is similar to the flat top suspension, but it is only 1 1/4 inches high from ear seat to top of flange. Its low height and large top bearing surface makes an extremely compact, strong suspension which will permit stringing the trolley wire close to the roof with sufficient tension to provide long hanger spacing and maximum head-room with safe clearances between trolley wheel flanges and the roof. The large top bearing surface is particularly advantageous in meeting the side strains on curves and grades.

Fig. 1 shows the low combination suspension and mechanical clamping ear fastened directly into the roof with an expansion bolt. This combination gives a clearance of 4 inches between the trolley wire and roof and is especially recommended for use in mines having limited head-room.

Fig. 2 shows the low combination suspension and mechanical clamping ear fastened into timber. This is an ideal suspension unit for use in low coal entries. The trolley wire is supported 4 inches from the roof.

Fig. 3 shows the combination suspension and combination clamp, supporting the trolley wire from the roof by means of a length of 1 1/4 inch pipe. By this method a level trolley wire can be maintained under an uneven top. A saw cut in the end of the pipe causes the ends to spread when driven into a hole in the roof over a tapered wooden plug.

Diameter of top flange, 4 inches; diameter of shell, 3 1/4 inches; length from ear seat to top of flange, 1 1/4 inches.

Fig. 3

Mining Suspension

Bracket Suspension

List No.	Description	Approx. Net Wt. per 100	List Price per 100
165188	Form H mining suspension, 3/8 in. stud, jappanned	275 lbs.	\$48.50
165189	Form H mining suspension, 3/8 in. stud, sherardized	275 lbs.	\$1.50

FORM H

Standard Mining Suspension

With Lag Screw and Wood Plug

This suspension consists of the standard Form H suspension with a gimlet point lag screw threaded into the top and projecting 3 inches above the tapped boss.

It is used in connection with a wooden plug, List No. 34137, which is drilled axially for the lag screw.

The plug is driven into a hole drilled in the mine roof and the lag screwed into the plug, its taper splitting the wood and expanding it permanently in place.

This is also an excellent ceiling suspension for use in timbered entries, or in car-barn wiring, the lag being screwed into the roof timbers.

The roof drilling should be 1 1/4 inches in diameter and 4 inches deep.

List No.	Description	Approx. Net Wt. per 100	List Price per 100
34135	Mining suspension, complete, 3/8 in. stud, jappanned	275 lbs.	\$52.75
34136	Mining suspension, complete, 3/8 in. stud, sherardized	275 lbs.	55.75
40966	Mining suspension, complete, 3/8 in. stud, jappanned	280 lbs.	79.75
40967	Mining suspension, complete, 3/8 in. stud, sherardized	280 lbs.	84.25
24137	Wooden plug (3 in. by 1 1/2 in.)	10 lbs.	2.50
36310	Lag screw (3/4 in. by 3 3/4 in. special)	25 lbs.	4.25

Brackets

The Form H bracket suspension consists of the standard 3 1/4 inch shell to which the bracket arm clamp is hinged, thus providing the flexibility required to care for vibration in the trolley wire.

For suspensions for 2 inch pipe the height from ear seat to center of bracket arm clamp is 5 1/4 inches; for 1 1/2 inch pipe the height is 4 3/4 inches; diameter of shell 3 1/4 inches. All metal parts including stud have standard sherardized finish.

List No.	Description	Approx. Net Wt. per 100	List Price per 100
25992	Bracket suspension complete, 3/8 in. stud for 2 in. pipe	540 lbs.	\$111.00
25993	Bracket suspension complete, 3/8 in. stud for 1 1/2 in. pipe	530 lbs.	106.00
25994	Bracket suspension, 3/8 in. stud, without clamp	275 lbs.	46.00
25996	Clamp for 2 in. pipe, for use with List No. 25992	265 lbs.	65.00
25997	Clamp for 1 1/2 in. pipe, for use with List No. 25993	255 lbs.	60.00

The clamps for the Form H bracket suspensions are the same as those used with Form G bracket suspensions.

Delivery F. O. B. Factory, Schenectady, N. Y. Free delivery F. O. B. destination on orders amounting to \$50 list and over to points east of the Mississippi River. Suitable allowance is made for shipments west thereof.

TROLLEY WIRE SUPPORTS

Fig. 1

Fig. 3

Fig. 2

Trolley Wire Support

Fig. 1 shows the flat top suspension and mechanical clamping ear fastened directly into the roof with roof bolt and wedges. This supporting unit gives a clearance of $4\frac{1}{4}$ inches between trolley wire and roof.

Fig. 2 shows the standard flat top suspension installed on timber giving $4\frac{1}{4}$ inches between trolley wire and roof. It is well adapted for general use throughout mines and mine yards where sufficient head room exists.

Fig. 3 shows the trolley wire supported from the side wall by a piece of $1\frac{1}{4}$ inch pipe driven into a horizontal hole. The combination pipe clamp and flat top suspension makes an ideal unit for supporting the trolley wire around curves under uneven top.

Combination Mine Suspension and Clamp

This suspension differs from the standard Form H mine suspension in the elimination of the boss above the flange. It may be attached directly to the mine roof by means of an expansion bolt or to timbers by means of special lag screws. Its design makes it possible to properly seat the suspension against the roof without forcing the expansion bolt into the roof hole beyond recovery.

This suspension is $2\frac{1}{2}$ inches in height and $3\frac{1}{4}$ inches in diameter; diameter of top flange is 4 inches.

List No.	Description	Approx. Net Wt. per Lb.	List Price per 100
125330	Form H combination mine suspension, sherardized.....	300 lbs.	\$51.50
125331	Form H combination mine suspension, japanned.....	300 lbs.	48.50
125334	Form H combination mine suspension, with lag screw, sherardized.....	325 lbs.	55.75

SUSPENSIONS, FORM D

In the Form D suspensions the cap and cone dovetail together in such a way as to prevent the formation of a film of moisture between them. The stud bolt head is made considerably larger than the opening in the body casting so that accidental breakage of the insulation will not allow the trolley wire to fall. A dead load of over 5 tons is required to crush the insulation between the stud cap and body.

A metal washer molded into the cone provides a positive bearing for the ear boss.

The lock washer, which is supplied only when specially ordered, engages directly with the screw cap and the body and effectively prevents any tendency to unscrew from vibration.

All metal parts including studs have standard sherardized finish.

LINE MATERIAL

Ears for Round Wire

The Forms H2 and J2 ears have a $1\frac{1}{4}$ inch hub flange and are suitable for suspensions presenting a large bearing surface at the base of their studs, such as the Forms H, S, D and P.

Form H2 Ears have a groove depth equal to the diameter of the wire so that when the lips are peened down and soldered the bottom of the wire is exposed, allowing unobstructed passage of the trolley wheel.

Form J2 Ears have an extra deep groove so that the lips approximately meet beneath the wire and are generally used without solder.

In the design of these ears all angles are filled with generous fillets, and in their manufacture extreme care is exercised to maintain accurate dimensions of the milled grooves and of the lips, which are tapered to a knife edge.

Grooves are milled to exact dimensions and, unless specially ordered, Form H2 Ears are tinned for soldering and Form J2 Ears are furnished untinned.

Form M Mechanical Ears for Round Wires

Form M mechanical clamping ears are used extensively in mine trolley construction.

The design of this clamp is such that it may be attached to the suspension and at the same time be made to grip the trolley wire by the single operation of turning the nut.

It is made of malleable iron with excellent wheel clearance and is $2\frac{3}{4}$ inches high and $3\frac{1}{2}$ inches long.

Form P2

LINE MATERIAL **Ears for Grooved Wire, Form P** **SOLDERED CLINCH**

Clinch ears for grooved wire are designed to be sprung on the wire by hand and the sides crimped together, making a snug fit. They are then usually soldered. Special attention is called to the fact that the grooves are formed to give an exact fit both at the groove bottom and the lips. The ears are furnished with lips tinned for soldering.

Strain Plate
Strain Plate

The strain plate consists of a malleable iron casting designed for support at the center by any standard straight line hanger, the center hole being tapped for either $\frac{3}{4}$ inch or $\frac{1}{2}$ inch stud. One-half inch holes are provided at each corner of the plate for attachment of guy wires. The double boss ears listed elsewhere are generally used with the strain plate, though the use of two screw clamp ears, either 5 inches or 7 inches long, is sometimes preferred.

Overall length 10 inches; length between centers of pull off eyes $7\frac{3}{4}$ inches; length between centers of stud bolts $7\frac{3}{4}$ inches; overall width $6\frac{3}{4}$ inches; width between centers of pull off eyes $5\frac{3}{4}$ inches. Standard sherardized finish throughout.

Turnbuckle

Wedge Grips with Clevis

Insulated Turnbuckles

Insulated turnbuckles are provided with drop forged steel eyebolts. In turnbuckles with malleable iron castings, the eyebolts are sherardized to prevent rusting and in the composition turnbuckles the eyebolt is heavily plated with copper. The casting is made in two halves which fit around the head of the insulated portion and are then riveted together, thus affording a resistance to tensile strain limited only by the ultimate breaking point of the solid metal. The swivel bearing is metal to metal and is so designed that there is no relative motion between the insulated portion and the adjoining head. The maximum draw-up for both sizes is 4 inches.

List No.	Description	Test Load in Lbs.	Average Breaking Load in Lbs.	Maximum Length Between Eyes in Ins.	Diameter of Eyes in Ins.	Approx. Net Wt. in Lbs. per 100	List Price per 100

Wedge Grip with Clevis

The wedge grip is designed particularly for fastening the ends of span, guy or trolley wires. The clamping action is very powerful as the long tapered steel wedges tighten under strain.

List No.	Description	Approx. Wt. in Lbs. per 100	List Price per 100
†138280	Wedge grip for ⅞ in. and 1½ in. diameter cables or 000 and 0000 trolley wire, mal. iron, sherardized	215	\$75.00
†147243	Wedge grip for ¾ in. and ¾ in. diameter cables or 0 and 00 trolley wire, mal. iron, sherardized	90	62.00

High Tension Insulator

The link strain insulator has exceptionally large creepage surface and in such form as to make it impossible for rain driving in any direction to maintain a continuous surface between terminals. The interlinking of the guy wires brings the material under compression strain only. They have dark chocolate color finish.

LINE MATERIAL

Giant Strain Insulators

Giant Insulator

Recent radical improvements in design give the giant strain insulator greatly increased mechanical strength and a dielectric strength to care for the potentials encountered in direct suspension work. The insulation under stress is exclusively sheet mica (under compression) and the limit of its mechanical strength is the rupturing limit of the metal parts without regard to temperature or other service conditions. The insulators are made in two sizes, having 2 in. and 2½ in. diameters, and equipped with standard and large eyes and standard and large clevises in any combination. All metal parts are sherardized.

SPHERICAL STRAIN INSULATORS

The spherical strain insulators are made in two sizes having diameters 2½ ins. and 2¾ ins. They are designed especially for use in span and guy wires in relatively light construction. The smaller size is suitable for a working load of 1000 lbs.; the average tensile strength is 3000 lbs. The 2¾ ins. size has an average tensile strength of 5000 lbs., and is suitable for a working load up to 2000 lbs. Both sizes are subjected to a potential test of 5000 volts.

TROLLEY WIRE FROGS

For different classes of service four sets of frogs, differing in the divergence angle of tongues and length of pan, are furnished.

For ordinary city service, with turnout radii not exceeding about 50 feet, the 20 deg. frogs are suitable, but, with the longer radii introduced by suburban and interurban work, smaller divergence angles are necessary.

A new frog having a divergence angle of 12 deg. and the pan portion arranged for the combination of city and interurban service can now be furnished.

The following table gives the range of distance from track switch point to track frog with which each set of Form G trolley frogs may be most satisfactorily used:

Frog Distance	Divergence Angle of Trolley Frog
Up to 22 feet	20°
From 20 to 30 feet	15°
Above 28 feet	8°

The minimum frog distance given in the table with which the 15 deg. frogs may be used to best advantage corresponds to a turnout radius of 40 feet, but when suburban cars, using high speed trolley wheels, run over city tracks it is advisable to use 15 degree rather than 20 degree frogs throughout the city construction even where the minimum frog distance is less than 20 feet.

In order to insure smooth transition of the wheel between tongue and pan, the pans of all Form G frogs have, at each end, an inclined plane rising at a very acute angle from the horizontal, which receives the flange of the wheel at a point depending upon the depth of the wheel groove. The depth of tongues and rise of the inclined plane admit the use of a groove depth of from $\frac{3}{4}$ inch to $1\frac{1}{4}$ inches.

Form K frogs have exceptionally long approaches with renewable end tongues which protect the trolley wire at the point of greatest wear.

All standard frogs are provided with four pull off rings, but similar frogs with two rings can be furnished if specially ordered.

The following diagram shows an excellent method of properly placing the frogs on the line, and while certain variables, such as super-elevation of the outer rail on the curve, length of wheel base, and projection of trolley pole rearward from center of car, will necessitate slight variation of setting, this location will be found so nearly correct that a very small alteration, which must be determined by experiment, will compensate for the variable conditions.

To Locate Trolley Frog

Form G. From switch point, A, draw a line to center point D, of frog distance BC, and from switch point B, draw a line to center point E, of arc AEC. The intersection of these two lines at F will be the proper location of the frog.

Form K. From switch point, A, draw a line to a point, D, one-third of the frog distance BC, from B, and from switch point B draw a line to a point, E, one-third of the arc EAC, from A. The intersection of these two lines at F will be the proper location of the frog. A pull off should be located on the turnout wire near C, so the turnout tongue of the frog points straight toward it.

ACUTE ANGLE

The acute angle crossings can be furnished either right or left hand. The right-hand crossing is considered standard and is generally applicable. However, under certain conditions, such as the crossing of a 250 and 500 volt line, right and left crossings are not interchangeable. The left-hand crossings are, therefore, listed, and will be made up on order at the same prices as the corresponding right-hand crossings.

DRAWBRIDGE FROG

16395	Complete, 1/2 inch tap, for Nos. 00, 000 and 0000 wire, comp.	15	7 1/4	875	\$855.00
15993	Without spring contact, comp.	15	7 1/4	890	541.50

Frogs similar to the above but for 1/0 wire will be furnished at the same price.
Delivery F. O. B. Factory, Schenectady, N. Y. Free delivery F. O. B. destination on orders amounting to \$50 list and over to points east of the Mississippi River. Suitable allowance is made for shipments west thereof.

LINE MATERIAL

Form G-2 Trolley Wire Frogs

The Form G-2 frogs are like the Form G, excepting in material and the arrangement of the end tongues. The body of the Form G-2 is sherardized malleable iron and the renewable end tongues are composition. The tongue proper, which is peened over the trolley wire, and the shoe, which clamps the wire under pressure from the large clamping nut, are in one piece and may be removed and replaced without in any way disturbing the frog body.

LINE MATERIAL
Trolley Wire Frogs
For Round or Grooved Wire

12 Degree Frog Form K

FORM K FROGS

This frog has extra long approaches with renewable end tongues. The body is malleable iron sherardized and the end tongues composition. The bolts for fastening the wire into the frog are $\frac{1}{4}$ inch in diameter and have square heads.

List No.	Description	Approx. Net Wt. in Lbs. per 100	List Price per 100
140109	Left-hand frog, for Nos. 0 and 00 wire, mal. iron, sherardized	2000	\$575.00
140110	Right-hand frog, for Nos. 0 and 00 wire, mal. iron, sherardized	2000	575.00
140107	Left-hand frog, for Nos. 000 and 0000 wire, mal. iron, sherardized	2000	600.00
140108	Right-hand frog, for Nos. 000 and 0000 wire, mal. iron, sherardized	2000	600.00
129977	V frog, for Nos. 0 and 00 wire, mal. iron, sherardized	2100	575.00
136004	V frog, for Nos. 000 and 0000 wire, mal. iron, sherardized	2100	600.00
150562	Renewable end tongue, for 0 and 00 wire, comp.	80	96.90
150563	Renewable end tongue, for 000 and 0000 wire, comp.	100	108.30

8 Degree Right-hand Frog

8 DEGREE HIGH SPEED FROGS

List No.	Description	Overall Dimensions in Inches Length Width	Approx. Wt. in Lbs. per 100	List Price per 100
58720	Right-hand frog, complete, with guard plate and clamping ears for Nos. 00, 000 and 0000 wire, comp.	23 $\frac{1}{8}$ 6 $\frac{5}{8}$	1900	\$2366.00
58721	Left-hand frog, complete, with guard plate and clamping ears for Nos. 00, 000 and 0000 wire, comp.	23 $\frac{1}{8}$ 6 $\frac{5}{8}$	1900	2366.00
58722	V frog, complete, with guard plate and clamping ears for Nos. 00, 000 and 0000 wire, comp.	23 $\frac{1}{8}$ 6 $\frac{5}{8}$	1900	2366.00

All pull off eyes are $\frac{1}{2}$ inch in diameter.

8 Degree Right-hand Frog

8 DEGREE RIGHT HAND FROGS

For line work where both wheel and sliding collectors are employed the following are recommended:

49054	Right-hand frog, for Nos. 00, 000 and 0000 wire, comp.	22	6 $\frac{1}{4}$	1375	\$912.00
59825	Left-hand frog, for Nos. 00, 000 and 0000 wire, comp.	22	6 $\frac{1}{4}$	1375	912.00
59826	V frog, for Nos. 00, 000 and 0000 wire, comp.	22	6 $\frac{1}{4}$	1375	912.00

All pull off eyes are $\frac{1}{2}$ inch in diameter.

Delivery F. O. B. Factory, Schenectady, N. Y. Free delivery F. O. B. destination on orders amounting to \$50 list and over to points east of the Mississippi River. Suitable allowance is made for shipments west thereof.

TROLLEY WIRE CROSSINGS

Adjustable Insulated Crossing

Crossings, Uninsulated, Form K

This crossing has the improved method of fastening the trolley wires and renewable end tongues to the body. The deflector bar prevents trolley poles from becoming caught in the angle between the runways. It is adjustable for any angle between 30 and 90 degrees.

List No.	Description	Approx. Wt. in Lbs. per 100	List Price per 100
141692	For 0 and 00 wire, mal. iron, sherardized	2100	\$600.00
141691	For 000 and 0000 wire, mal. iron, sherardized	2100	600.00
150562	Renewable end tongue 0 and 00 wire, comp.	80	96.90
150563	Renewable end tongue 000 and 0000 wire, comp.	100	108.30

Right Angle

Right Angle Crossing, Form G

This crossing is similar to the right angle crossing for wheel collectors, List No. 11297, excepting that in the pan is provided a double groove runway for wheels, and heavy extension flanges offer a smooth underrun for sliding collectors.

For use where both wheel and sliding collectors are employed, the following is offered:

64170	For Nos. 00, 000 and 0000 wires, comp.	1000	\$684.00
-------	--	------	----------

Adjustable Crossing

Adjustable Crossing, Form G

The adjustable crossing is composed of light structural steel sections with sherardized finish, having a dip at the center point to provide clearance for the passage of the sliding collector.

48835	Adjustable crossing for Nos. 00, 000 and 0000 wires	4000	\$900.00
-------	---	------	----------

Delivery F. O. B. Factory, Schenectady, N. Y. Free delivery F. O. B. destination on orders amounting to \$50 list and over to points east of the Mississippi River. Suitable allowance is made for shipments west thereof.

All pull-off eyes are $\frac{1}{2}$ inch in diameter.

Crossings, Form G, Uninsulated

The principle of the inclined plane to insure smooth transition of the trolley wheel between tongue and pan has been embodied in the design of all Form G crossings, and the maximum speed at which the trolley will operate at crossing points has been greatly increased thereby. They will accommodate round or grooved wire of the size indicated in the tables.

The Form G adjustable crossing can be set at any angle between 30 and 90 degrees.

LINE MATERIAL

Crossings, Form L, Insulated

The Form L insulated crossing consists of a beam of selected second growth hickory thoroughly impregnated with preservative oils to exclude moisture, finished with black japan, and castings of standard composition metal, with a replaceable white fiber runway. Attachment to the trolley wires is effected by mechanical clamps so that the crossing may be installed quickly without soldering and without cutting either wire.

The fiber runways as listed include fiber plates with screws. The crossings will accommodate round or grooved wire of the size indicated in the tables.

Right Angle Crossing

SINGLE TROLLEY CROSSINGS

INSULATED CROSSINGS

For Round, Grooved or Figure 8 Wires

Right Angle Crossing

Form L Insulated Crossings—Double Trolley

The double trolley crossings consist primarily of an insulating beam and two cross-tongues spaced suitably for use where the double trolley wires are $6\frac{1}{2}$ inches between centers. Crossings with tongue spacing either greater or less than standard will be supplied for special conditions at prices corresponding to the standard.

Crossings consisting of two insulating beams and a single cross-tongue or with two beams and two cross-tongues (for the crossing of two double trolley lines) are built to order.

Overall length $43\frac{1}{2}$ inches; overall width $18\frac{1}{2}$ inches.

List No.	Description	Approx. Net Wt. in Lbs. per 100	List Price per 100
46185	Right-angle crossing, for Nos. 00, 000 and 0000 wires, $6\frac{1}{2}$ ins. between trolley centers.....	1925	\$2700.00

100931	White fiber runway, for List No. 100186.....				425.00

Crossings similar to the above, but for 0 wire, will be furnished at the same price.

Delivery F. O. B. Factory, Schenectady, N. Y. Free delivery F. O. B. destination on orders amounting to \$50 list and over to points east of the Mississippi River. Suitable allowance is made for shipments west thereof.

LINE MATERIAL

Form L Section Insulator

The Form L section insulator consists of a beam of selected second-growth hickory well seasoned and treated with preservative oils to exclude moisture, finished with black japan, and castings of the standard composition metal, with a replaceable runway of hickory. Attachment to the trolley wires is made by double mechanical clamps at each end. The wood runway in conjunction with the accurately aligned castings offers a straight under-run, insuring a smooth passage for the trolley wheel. For 600 volt service the wood runway provides a 7 inch break in the trolley circuit; for 1200 volt service the break is 12 inches.

The insulators will accommodate round or grooved wires of the sizes indicated in the tables.

Section Insulator

Automatic Section Insulator—600 Volts

This device is a combined section insulator and automatic section switch, and, while it is designed especially for use in mine tramway work, may often be used to advantage on spur tracks in surface work, where it is desirable to cut out the spur section after the car has run back on to the main line.

The switch blade is operated by the trolley wheel, and is permanently connected to the feeder or to the main line trolley wire. Over all length 30½ inches; height 5½ inches.

LINE MATERIAL

Form L-4

**Section Insulators, Form L
DOUBLE BEAM**

Form L-4 section insulators consist of two side beams of selected oil treated maple which are fastened to malleable iron end castings. The body of the insulator is provided with span holder and pull-off eyes so it can be permanently wired into the overhead construction. The runway is perfectly level and all wearing parts, including end tongues, arcing casting and wooden wheel guide, can be renewed without disturbing any of the wires. The trolley wire is fastened into the end casting by a long tapered steel wedge, driven in on top of the wire. This insulator will break a 4/0 trolley under tension test without injury to the insulator. Suitable clamps are provided for 4/0 feeder tap.

SECTION SWITCHES

Automatic Sectionalizing Switch

Automatic Sectionalizing Switch

The switch is connected across the section insulator by the taps G and H. Circuit breaker B on being closed energizes section B and current passes through tap G, switch blade Y, contactor operating coil X to contact stud on relay which is open circuited. On closing circuit breaker C, section C is energized, current passes through tap H, switch blade Z, and relay operating coil W to ground, closing the relay disk V. This in turn completes the circuit through the contactor operating coil X, causing the contactor to close and completing the circuit across the insulator, thus placing all feeders in multiple. It will be noted that under these conditions should cars become banked in any one section, current from the other sections will be fed across the section insulators, thus increasing materially the efficiency of the entire copper distribution. The switch will not operate until both breakers, feeding the sections it is connected to, are closed.

In systems where these switches have been installed, exchange current readings taken during rush hours, as high as 600 and 700 amperes have been recorded, with a resultant increase in potential of from 100 to 150 volts.

For Railway Feeder Systems

The automatic sectionalizing switch herein illustrated and described is designed to improve the efficiency of direct current feeder systems by permitting all section feeders to be placed in multiple. This is accomplished by connecting the switch directly across the section insulators which, while giving all the advantages of the non-sectionalizing system, does not, in consequence of the automatic operation of the switch, do away with the beneficial results gained from a sectionalized system.

Suppose the trolley or third rail system to be divided into three sections, A, B and C (see connection diagram Fig. 1) and cars become banked during rush hours, etc., in section B, it will be seen that under the general conditions of section feeding the feeders to sections A and C will be idle while the feeder to section B will be insufficient, with a resultant drop in potential and consequent bad operating conditions.

The system, however, can be made continuous and all feeders placed in multiple by the use of the automatic sectionalizing switch, the operation of which is described as follows:

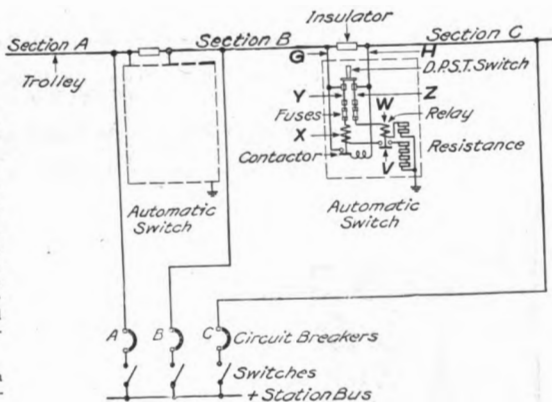

Fig. 1
Connections of Automatic Sectionalizing Switch on Direct Current Trolley System

Connections of Automatic Sectionalizing Switch on Direct Current Third Rail Systems—Rails Continuous between Substations

In cases of short circuits the isolation of the section affected is very simple. A short circuit occurring on section A will, as the system is continuous, cause Breakers A, B and C to drop out and all automatic switches to open circuit. When the station operator closes Breaker A, it will at once open, showing the locality of the trouble. He will next close Breakers B and C, which will energize these sections, causing the automatic switch to close and tying the two sections together.

When the short circuit in section A has been remedied, Breaker A can be closed, automatically tying in section A with the rest of the system.

Attention is especially called to the fact that a section cannot be isolated, i. e., both sectionalizing switches will not drop out, until the circuit breakers feeding the two adjacent sections and the breaker feeding the section to be isolated, have been tripped. After the sectionalizing switches have thus been open circuited, the breakers feeding the two adjacent sections can be closed.

CONSTRUCTION

The sectionalizing switch and box enclosing it are constructed and finished to withstand severest weather conditions. As the location and suspension of the switch depend on local conditions, no brackets are furnished.

This switch is highly recommended to customers wishing to improve their operating conditions without the large outlay for feeder copper generally necessary. Its use is also highly recommended in the original layout of feeder systems since by its adoption a smaller cross section of feeder copper can be utilized.

Mine Roof Drill

No. 16915

No. 100077

No. 27437

Mine Roof Drill

This post drill is suitable for drilling holes in the mine roof for installing the trolley wire supports. It can be set up to drill at any angle in coal, slate or medium rock. It is made up very light and simple, weighing, without augers, about 50 lbs. so it can be easily transported and set up by one man.

The post has an extension of two-thirds of its length. For example, a 3 foot post can be extended to 5 feet. Drills having any height post can be furnished with feed bars having 8, 10, 12 or 14 threads to the inch; also augers of any diameter and length. The standard machine has 4 foot post and includes a set of 1 1/4 inch augers, 12, 24 and 36 inches long; also standard crank handle. A simple ratchet handle or a double acting ratchet handle can be furnished if desired.

LINE MATERIAL FOR CATENARY CONSTRUCTION

Brackets

The angle iron bracket by reason of its horizontal stiffness greatly facilitates initial adjustment of the messenger during installation and insures maintaining uniform sag in messenger span throughout the length of the tangent. Its horizontal stiffness is also of great value in case of line breakage, the line remaining undisturbed except for two or three spans on either side of the break.

The angle bracket consists of two $2 \times 1\frac{1}{2} \times \frac{1}{4}$ inch angle irons joined at the extreme end by a space block and rivet, and by a second space block approximately 2 feet nearer the pole. The guy rod which supports the bracket from the pole top is attached to this second space block, and the slot formed between the angles by the space blocks through which the insulator pin bolt passes provides means for transverse adjustment of the messenger with respect to the track. The inner ends of the angles are sprung apart to span the pole to which they are lagged or bolted. This bracket is suitable for 7 feet 6 inches distance between track center and pole face.

Angle Iron Bracket Arm, No. 43322

SINGLE BRACKET

List No.	Description	Approximate Weight in Lbs. Each	List Price Each
43322	9 ft. angle iron bracket, japanned	60	\$3.85
For each additional 6 inches in length (weight 2.5 lbs.), add 12 cents to list price.			

No. 47016

DOUBLE BRACKET

For double track pole construction a bracket arm having two guy rods and two sets of fittings is used. This double bracket is riveted at one end and bolted at the other to allow for spanning the pole in installation. It is 16 feet over all and suitable for 14 foot track center.

List No.	Description	Approximate Weight in Lbs.	List Price Each
47016	16 ft. double angle iron bracket, japanned	110	\$6.65

No. 48415

DOUBLE BRACKET

For double track work with 14 foot track centers the "T" iron bracket consists of two arms, two guy rods and two sets of fittings, each arm being 7 feet 6 inches long.

48415	Double "T" iron bracket with arms, 7 ft. 6 ins. long, $2\frac{1}{4} \times 2\frac{1}{4} \times \frac{1}{8}$ in., japanned	100	\$6.70

Railway Material

LINE MATERIAL FOR CATENARY CONSTRUCTION

"T" Iron Bracket No. 48414

The "T" iron bracket has all of the advantages of the angle iron bracket, excepting its stiffness in the horizontal plane. The guy rod is attached to the arm approximately 2 feet from the end and the extension beyond the guy rod attachment provides for transverse adjustment of the messenger.

The "T" iron bracket consists of a "T" arm, guy rod, pole fitting and two 5 inch by $\frac{1}{2}$ inch lag screws, but does not include insulator pin. The length of the standard "T" iron bracket is 8 feet 6 inches which is suitable for 7 feet 6 inches distance between track center and pole face.

List No.	Description	Approx. Wt. Each	List Price Each
134746	8 ft. 6 in. "T" bracket, $2\frac{1}{4}$ x $2\frac{1}{4}$ x $\frac{1}{4}$ in., japanned	40 lbs.	\$3.20
48414	8 ft. 6 in. "T" bracket, $2\frac{1}{4}$ x $2\frac{1}{4}$ x $\frac{1}{4}$ in., japanned	55 lbs.	3.75
124591	9 ft. "T" bracket, $2\frac{1}{2}$ x $2\frac{1}{2}$ x $\frac{1}{4}$ in., japanned	75 lbs.	4.30

"T" Sliding Bracket

For sidings and spur tracks the "T" iron bracket consists of arm, guy rod and a set of castings. The outer end and center castings support the flexible span wire $9\frac{1}{4}$ inches below the top of arm.

147392	9 ft. "T" bracket $2\frac{1}{4}$ x $2\frac{1}{4}$ x $\frac{1}{4}$ in., japanned	56 lbs.	\$435.00
		70 lbs.	492.00

Bracket curve construction for large radius curves of three degrees and under, consists of a bracket of increased length and an outer end or extension casting for attaching the pull off. When necessary the extension casting may be reversed and the trolley pulled off toward the pole.

Steadying Bracket

For steadying the line brackets consisting of a bracket of increased length, outer end or extension casting together with a double curve yoke, eye, insulators, eyebolt and cable are recommended.

Pull-off Hangers

In order to insure clearances for the passage of sliding collectors, the pull-off hangers are designed for use with bridles which are attached to the ear and the upper part of the pull-off stem, and which lead to the pull-off insulator or to a steel ring into which the wire is made up.

The Form CA pull-off hanger has the messenger clamp casting threaded to the stem and the distance between messenger and trolley wire is therefore fixed by adjustment when installing. These hangers are adjustable through a length of one and one-half inches greater and less than the nominal length. The stem of the Form CA hanger is ¾ inch in diameter.

List No.	Length in Ins.	Approx. Wt. in Lbs. per 100	List Price per 100
48439	14	480	\$140.00
48440	17	500	140.00
48441	20	520	140.00

The Form CG pull-off hangers are similar to the Form CA hangers except that the clamping ear is provided with carriage bolts instead of flat head screws for tightening the ear on the trolley wire. The messenger clamp is also much simplified. This hanger has 1½ inches adjustment.

List No.	Length in Ins.	Approx. Wt. in Lbs. per 100	List Price per 100
135519	20	490	\$115.00
135520	17	450	115.00
135521	14	410	115.00

Form CH pull-offs consist of a separate messenger pull-off clamp and trolley ear with yoke, together with a steel strut for maintaining the proper dimension between wires. Flexibility is obtained at pull-off points by this construction, as the strut is located to one side of the trolley and messenger wire permitting an upward yield of the trolley wire from the passing collector.

For wheel operation an ordinary single curve yoke with eye is used and for pantagraph operation a single curve yoke having a long extended arm to provide the necessary clearance should be used.

The messenger clamp is arranged so that pull-off wire can be run through the clamps without cutting the wire in extra track construction.

A strut should be installed between each track.

Delivery F. O. B. Factory, Schenectady, N. Y. Free delivery F. O. B. destination on orders amounting to \$50 list and over to points east of the Mississippi River. Suitable allowance is made for shipments west thereof.

LINE MATERIAL FOR CATENARY CONSTRUCTION

Pull-off Hangers (Continued)

The messenger pull off is suitable for $\frac{1}{4}$ inch and $\frac{1}{2}$ inch diameter messenger wires and $\frac{1}{4}$ inch and $\frac{1}{2}$ inch diameter of pull off wires. It is made of malleable iron and standard "T" bolts sherardized.
The struts are of suitable length for standard 22 inch deflection, but on large propositions it is often necessary to have other lengths for special conditions.
The strut consists of a $1 \times \frac{3}{4} \times \frac{1}{4}$ inch channel iron together with standard "T" bolts sherardized.

Anchorage Material

To provide vertical flexibility at anchorage points in lines using the Form CP tangent and pull off hangers, the trolley wire and messenger are clamped independently and the clamps guyed to the anchor eye through a strain insulator and a turnbuckle.
The Form CA anchor hanger for use with Form CA tangent and pull off hangers is fitted with a $\frac{5}{8}$ inch steel stem and is arranged for guying to the anchor eye through a bridle with suitable strain insulator and turnbuckle.
Either method of anchoring provides ample clearance for sliding collectors and prevents forming "pockets" or angles between trolley and guy wires in which a collector may catch.
All anchorage devices excepting ears, which are of composition and tinned for soldering, are sherardized throughout.

RAIL BONDS

Owing to the many types and the variation in dimensions of rails and joint plates in common use a great variety of forms of bonds has been developed to meet the widely varying conditions encountered in actual and prospective installations.

Occasionally exceptional cases arise requiring some modification of one of the standard forms of bonds in order that the best results may be obtained. The manufacturer will gladly submit recommendations with drawings showing how best to meet any bonding conditions, and its engineering department is always at the service of customers to give expert advice on this important subject.

Requests for recommendations should be accompanied by the following data:

General conditions of load.

Size of trolley and feeder wires.

Name of maker and section numbers of rail and joint plate, or a sketch showing section through rail and joint plate.

If patented joint, give its name, distance from end of rail to center of first bolt hole, and distance between center of first and second bolt holes, diameter of joint plate bolts and length of joint plates.

This Company strongly recommends that customers follow its suggestions and thereby avoid difficulties which would be encountered by overlooking certain points in the selection of rail bonds.

Only the best grade of pure copper having the requisite physical properties of conductivity and ductility is permitted to enter into the construction of these rail bonds.

The terminals are first forged into shape and then formed or drilled for the reception of the conductor.

After the parts are assembled, the portion of the bond to be welded is subjected to very heavy pressure while cold, for the purpose of excluding air from between the surfaces. This patented process, employed in the manufacture of all this Company's welded bonds, operates to prevent oxidation of the parts during welding; moreover, because of it the temperature required for welding is considerably below the point at which copper may be "burned" or otherwise injured.

It is well known that copper surfaces, if exposed to the air while hot, will not unite perfectly unless heated practically to the flow point, incurring grave danger of "burning."

A rigid inspection system, devised to carefully check every operation in the manufacturing process, is constantly enforced and assures the best of material and workmanship.

Mine Bonding. The bonds now used in many mines, consisting of channel pins and short lengths of copper wire, upon inspection and testing are frequently found to be in such poor condition and of such high resistance that the return current leaves the rails and follows adjacent pipe lines and streams of water on its way back to the power house.

The channel pin bonding when first installed offers little resistance and test readings equivalent to 6 to 8 feet of solid rail can be obtained, but the contact between the pin and rail being open to moisture, corrosion soon starts and the resistance steadily increases until it reaches a point where the value of the bond is entirely lost. The solid wire ordinarily used with channel pins has no flexibility and the vibration caused by trips passing over the joints has a constant tendency to loosen it in the pins.

Numerous tests made by the manufacturer, of channel pin bonds under the varying conditions encountered in mine work, have proven conclusively that this type of bond does not fulfill the requirements efficiently and that it is responsible for a large percentage of the troubles incident to electric haulage; e.g., low voltage, and armature and field burnouts. It also places an unnecessary load on the generating plant. The results of a large number of tests show clearly that over fifty per cent. of the channel pin bonds, six months or more after installation, have a resistance greater than that of an entire length of rail, and the balance of the joints have an average resistance equaling that of two-thirds of a rail length. It is impossible to obtain anything like efficient operation of electric locomotives over tracks bonded in this way.

To take the place of the inefficient channel pins the compressed terminal bonds are recommended. By their use the joint resistance may be reduced to the equivalent of from one-tenth to one-sixth of a rail length. This immediately improves voltage conditions, and the number of motor burnouts will be reduced to a minimum. More cars per trip can be handled, and the increased efficiency of the generating plant will easily offset the higher first cost of the bonds. Compressed terminal bonds properly installed show no material increase in joint resistance after four or five years' service under ordinary mine conditions, thus the saving in maintenance alone justifies the higher first cost of installation.

In installing compressed terminal bonds a hand compressor should be used.

This compressor will exert a pressure of 15 to 20 tons on the terminal, compressing the copper into the hole in the rail and forming an intimate contact. A button head is formed during compression which effectually seals the contact surface against the entrance of moisture.

For small rails when the full current capacity is to be utilized, Form D bonds, installed around the plates, are recommended, and, if given proper care in installation, give excellent results.

A specially wound cable composed of many fine wires gives great flexibility, relieving the terminals from vibration strains. The bonds should be installed on the inside of the rail as close under the heads of the track bolts as possible. This reduces to a minimum the possibility of damage to the bonding when cars are derailed. Actual observations show that bonds installed in this manner have been run over by the wheels of derailed cars without material injury to the bonds.

It is recommended that all permanent haulage tracks be bonded to their full capacity with compressed terminal bonds and the use of channel pins be limited to temporary tracks to rooms and chambers.

RAIL BONDS

Rail Bond Application

Rails. The resistance of steel rails is found to vary considerably, due to differences in chemical composition. Thus, steel suitable for third rail where large currents are carried generally has a special low carbon composition with a resistance approximately eight times that of copper, that is, a 100 lb. third rail having 10 square inches sectional area has a resistance equivalent to that of 1,591,546 circular mils of copper. Ordinary running rails are of high carbon steel and their resistance averages closely 12 times that of copper. That is, an 80 lb. running rail having a sectional area of 8 square inches has a resistance equivalent to that of 848,825 circular mils of copper.

COPPER EQUIVALENT OF STEEL RAILS

The following table gives in circular mils the sectional area of copper equivalent to steel rails of various weights and having various resistance coefficients.

Weight of Rail Lb. per Yard	Ratio of Resistance of Steel to Resistance of Copper					
	8 C.M.	10 C.M.	12 C.M.	13 C.M.	14 C.M.	15 C.M.
12	190,988	152,850	127,323	117,529	109,134	101,858

45	716,196	572,930	477,463	440,735	409,253	381,968
50	795,773	636,618	530,515	489,705	454,725	424,410
60	954,928	763,942	636,618	587,646	545,670	509,292
70	1,114,083	891,266	742,721	685,587	636,615	594,174
75	1,193,660	954,927	795,773	734,558	682,087	636,615
80	1,273,238	1,018,589	848,825	783,528	727,560	679,056
90	1,432,393	1,145,913	954,928	881,469	818,505	763,938
100	1,591,546	1,273,236	1,061,030	979,410	909,450	848,820

The area of the cross section of a rail is approximately one-tenth of its weight in lbs. per yard and its copper equivalent in circular mils is approximately 10,000 times its weight in lbs. per yard at the 12 to 1 ratio.

In selecting rail bonds for a particular installation the following data will be found useful in determining the size of bond required to prevent an unreasonable drop in voltage in the return circuit.

RESISTANCE OF STEEL RAILS IN OHMS AT 75 DEGREES F., NO JOINTS

The resistance of bonded rail will vary depending on the amount of contact made by the splice bars and rail ends, but in selecting bonds it is advisable to disregard this element of the return circuit as it is unreliable and frequently quite negligible.

Terminals

In determining the length and diameter of standard bond terminals, careful investigation and tests were made by compressing samples in blocks of steel having a thickness equal to that found in the standard rail webs. The terminal lengths here given as standard allow sufficient stock to completely fill the hole in the rail and form a button head outside to seal over the contact surfaces, so as to prevent the entrance of moisture between terminal and rail.

DIMENSIONS OF STANDARD SOLID TERMINALS

Size of Conductor	Diam. of Stud	Dimensions in Inches Length of Stud	Contact Area on Rail	Contact Resistance Ohms
1/0	1/4	1 1/2	0.88	0.0000080
2/0	5/16	1 3/4	1.10	0.0000064
3/0	3/8	1 7/8	1.33	0.0000053
4/0	7/16	2	1.55	0.0000045
50000 C.M.	1	2 1/2	1.77	0.0000040

The contact areas given in the table are correct for rails having the web $\frac{1}{8}$ inch thick. For rails having other thicknesses of web, add or deduct 3 per cent. for each $\frac{1}{16}$ inch in thickness.

The terminals of all tubular terminal bonds are $\frac{5}{8}$ inch long.

RAIL BONDS

Rail Bond Application—Concluded

RESISTANCE OF BONDS IN OHMS AND CARRYING CAPACITY IN AMPERES

Size of Conductor	Diam. of Terminal	Resistance per Inch of Conductor at 75 Deg. F.	Ampere Capacity
1/0	1 1/2 in.	0.00000829	210
2/0	1 3/4 in.	0.00000657	265
3/0	2 in.	0.00000521	335
4/0	2 1/4 in.	0.00000414	425
250,000 C.M.	2 1/2 in.	0.00000350	500
300,000 C.M.	1 in.	0.00000275	600
350,000 C.M.	1 in.	0.00000250	700
400,000 C.M.	1 in.	0.00000219	800
450,000 C.M.	1 in.	0.00000198	900
500,000 C.M.	1 in.	0.00000175	1000

The ampere capacity given in the table is the maximum current which the bond will carry continuously without showing an appreciable rise in temperature when the bond is installed on the rail where it will be exposed to the air. If concealed by joint plate only a slight increase in temperature will be shown as concealed bonds are usually of short length and the heat will be dissipated rapidly through the terminals into the rail.

Load currents of two or three times the amount given in the table can be carried for short periods without injurious heating.

In general, however, the total cross section of the bonds on a road should equal the total cross section of the copper trolley wire and feeder cable.

In the following table will be found the approximate resistance per joint of the standard size rails bonded at 75 degrees F. with bonds of a length and size most commonly used. The resistance of joints bonded with bonds of other lengths and sizes can be computed by referring to the above tables.

Wt. of Rail per Yard	Size of Conductor	Diam. of Terminal	Length of Bond	Resistance of Joints (Single Bonded)	Resistance per Mile of Rail with 170 Joints (Single Bonded)

100 lbs.	500,000	1 in.	16 ins.	0.0000288	0.05855

It is generally impossible in actual practice to ascertain the exact amount of current flowing in the rail because the current is constantly changing in value. This renders difficult the securing of accurate reading for computing the ohmic resistance of the joints. For this reason the common practice is to test bonding by means of instruments embodying the Wheatstone bridge principle. Such instruments by direct reading indicate the length of unbroken rail required to give a drop in voltage equal to that across the joint. The resistance, therefore, is expressed in feet of unbroken rail.

The amount of joint resistance permissible in good bonding depends on the size of the rail and the size of the bonds used: In mine and industrial installations the weight of rails used is ordinarily 20 to 40 pounds per yard and they are bonded with 0 and 00 bonds, 20 to 26 inches long. The average resistance of such joints in good condition should be equal to that of 4 1/2 to 6 feet of unbroken rail. On rails of medium sizes (60 to 80 lbs.) bonded with 0000 bonds, 9 or 10 inches long, the average resistance per joint should be that of between 3 and 4 feet of rail.

For the heavy rails (90 to 110 lbs.) bonded with 400,000 C.M. and 500,000 C.M. bonds, 14 or 16 inches long, the average resistance per joint should be equal to that of 2 feet of rail.

Joint resistance of more than twice that indicated as good bonding for small and medium sized rails or more than two and one-half times that indicated for heavy rails shows decidedly inferior bonding which should be replaced at once.

In order to obtain uniformly good results, particular care should be taken while installing bonds to have the walls of the holes in the rails and the surface of the bond terminals bright and clean, and free from moisture. Where these simple precautions are taken, joints of low resistance will be obtained and will show practically no increase in resistance after years of service.

RAIL BONDS

COMPRESSED STUD TERMINAL BONDS

The studs of these bonds are of solid copper slightly tapered and have a depression in the center of the bottom surface for centering the compressor screw when installing.

The accompanying illustration shows in section a $\frac{3}{4}$ inch diameter terminal compressed into a $\frac{3}{4}$ inch diameter hole in a piece of steel $\frac{1}{4}$ inch thick, representing the web of a rail. It was compressed with a double-screw compressor, exerting a pressure of 20 tons, operated by one man with the standard 40 inch wrench. Two annular grooves $\frac{1}{4}$ inch wide and $\frac{1}{4}$ inch deep were cut in the walls of the hole, and it will be observed that the grooves became completely filled with copper. This indicates that the studs are soft and malleable, flowing easily and evenly under the pressure of the screw and that the compressor screw forces the copper back into the hole, entirely filling it before it forms the rivet head over the hole.

Holes should be drilled with well sharpened tools so that the walls and edges of the hole will be smooth and free from burrs and other irregularities. Bond holes should be of the exact diameter of the bond stud to be inserted.

Oil should not be used in the drilling of holes, as all traces of it cannot readily be removed from the hole, and oil will prevent proper contact between the copper and the steel. A solution of soda and water or plain water may be used, but care should be exercised to see that the hole is wiped perfectly dry before the terminal is inserted. Bonds should not be installed in damp weather. If these simple precautions be disregarded the electrical efficiency of the bonding will be greatly affected.

If bond holes have been drilled some time prior to the applying of the bonds, the holes should be reamed, as a clean, bright contact is essential.

Rail bond terminals should be rubbed clean and bright with a piece of fine emery cloth before they are inserted in the rail.

Rail bond studs should never be upset with a hammer. Hammering a terminal merely puts a rivet head over the hole, and does not force the copper back into contact with the steel surrounding the hole.

Form D Solid Terminal Cable Bond

The compression method of installing bonds is admitted generally to be the correct one. After the head of the bond has been drawn up tightly against the web of the rail by the outer screw of our special compressor, the inner screw forces the copper back into the hole. The compressing portion of this inner screw is so designed that a rivet head cannot be formed on the terminal until the hole has been completely filled, even to the point of the steel. The rivet or button head seals the union, and insures practically a moisture-proof joint. A solution of red lead and linseed oil may be applied to the terminal and adjacent steel, after compression. This will effectually seal the joint against the admission of moisture.

To effect radial expansion of the copper in the hole equally in all directions, the inner screw of the bond compressor should be centered in the depression in the end of the terminal.

TUBULAR STUD TERMINAL BONDS

These bonds are like compressed stud terminal bonds except that the studs are drilled for expanding radially in the holes in the rails. The terminals are smooth, milled to exact size and are of one length. The illustration shows a sectional view of a tubular terminal expanded into a steel block representing the web of a rail. The effects of the expansion by the taper punch and drift pin are clearly shown.

The same general precautions in regard to drilling the rail and preparing the terminals should be taken as with compressed terminals. Greater care should be used, however, in having the hole drilled to size to insure the best results. After inserting the terminal in the hole, a long taper punch, well lubricated with oil or grease, is driven entirely through the terminal. The diameter of the punch is $\frac{1}{4}$ inch larger than the hole in the terminal and it therefore forces the copper in the terminal radially against the walls of the hole. A short drift pin $\frac{1}{4}$ inch larger than the maximum diameter of the taper punch is then driven home in the terminal, thus completing the expansion. In driving in the drift pin the copper of the terminal is slightly further expanded and a portion lying close to the pin is forced along by the pin out through the hole in the rail and expanded into a bell mouth. The diameter of the hole through the terminal is increased about $\frac{1}{4}$ inch by the action of the taper punch and drift pin, forcing the copper into intimate contact with the steel rail. Tubular terminal bonds are particularly advantageous in rebonding on paved streets and around special work or where dense traffic forbids the somewhat longer operation of installing compressed terminal bonds.

Form DT Tubular Terminal Cable Bond

**Taper Punch for Installing
Pin Terminal Bonds**

**Drift Pin for Installing
Pin Terminal Bonds**

Dimensions of Taper Punches and Drift Pins

Steel drift pins are included without charge in all shipments of tubular terminal bonds. Taper punches can be supplied when ordered.

Size of Bond Conductor	Dimensions in Inches			Taper Punch	
	Diameter Terminals	Diameter Hole	Diameter of Drift Pin	Max. Diameter in Inches	Length in Inches
Above 4/0	1	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{5}{8}$	5
Above 4/0	$\frac{3}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{2}$	4
Above 3/0	$\frac{3}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{2}$	4
Above 2/0	$\frac{3}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{2}$	3 1/4
Above 1/0	$\frac{3}{4}$	$\frac{1}{4}$	$\frac{1}{4}$	$\frac{1}{2}$	3 1/2

Standard drift pins are accurately machined, are free from burrs or sharp corners, and are sherardized to protect them from rusting.

RAIL BONDS

FORM D CABLE BONDS

Exposed Bonding. Bonding around the outside of joint plates with either Form D or Form DT bonds has now become the accepted standard practice and is generally used on mine haulage systems. The comparatively light weight rails used do not provide ample clearance for a concealed bond of the required capacity, and as the track in and about mines generally is not maintained in the condition usually found in railway installations, the short concealed bond is liable to be injured due to excessive movement of the joint.

These cable bonds have conductors of specially wound cable. The many fine strands are counterlaid with a short pitch. A long protecting sleeve encircles the cable where it emerges from the terminal protecting the strands during manufacture and strengthening the cable against the movement of the joint in service. Their length provides ample flexibility. A coat of heavy black paint applied over the bond will reduce theft. Some companies using this style of bond have minimised theft by taking precautions to bring to speedy justice each of the early offenders. A special cable having identification wires can be supplied if desired to enable positive identification in case of theft.

Forms D and DT cable bonds have terminals with offset shanks. The sleeve portion diverges from the web of the rail at

Form D Bond Spanning Joint Plate of T Rail

an angle of 20 degrees, thereby avoiding any sharp bends in the conductor in spanning a joint plate. The shanks of bonds to be used under the plate are at right angles to the terminal studs.

Forms D and DT cable bonds should be at least 6 inches longer than the joint plate which they are to span. The length is measured between centers of terminals when the bond is straight and extended.

FORM E SOLID WIRE BONDS

Solid wire bonds are suitable for bonding rigid structures and heavy rails laid in concrete and supported by the adjacent pavement. There is very little flexibility in this style of bond and its use is limited correspondingly.

Form E-2 Solid Terminal Solid Wire Bond

Form ET-2 Tubular Terminal Solid Wire Bond

The above bonds are for use in spanning joint plates. The bonds are factory formed so as to provide proper clearance around the plates.

Form E Bond Spanning Joint Plate of T Rail

A bond having a formed length at least 6 inches longer than the plate should be used. The formed length is $1\frac{1}{2}$ inches less than the actual developed length when a bond is straight and extended.

Form E-1 Solid Terminal Solid Wire Bond

Form ET-1 Tubular Terminal Solid Wire Bond

Cross bonds should be at least 10 inches longer than the track gauge. This length permits burying the conductor in the ground, thereby reducing the liability of theft.

The length is measured between centers of terminals when the bond is straight and extended.

TWIN STUD TERMINAL BONDS

The twin stud terminal is another form of rail bond terminal which offers an efficient mechanical and electrical contact with the rail. The accompanying illustration shows a section through the terminals and a steel block after installation by the regumering of the terminal into the rail has completely filled these grooves anchoring the copper into the steel mechanically and sealing the contact area from the entrance of moisture. The terminals are accurately milled to size.

Application. The four holes in the head of the rail are drilled simultaneously by the four-spindle drilling machine and the bonds applied with a riveting hammer. The same general precautions of (See following page.)

Railway Material

RAIL BONDS

TWIN STUD TERMINAL BONDS—Concluded

avoiding the use of oil in drilling the rail, and the necessity of having the surfaces of the terminal bright and clean apply in the case of twin terminal bonds just as with other forms.

Section of Twin Stud Terminal Bond

After drilling the rail the sharp edges of the holes should be dulled with a blunt punch to avoid cutting the terminal studs as they enter the holes. An annular groove about $\frac{1}{16}$ inch deep should be cut near the orifice of each hole with the hand milling cutter.

The depth of the hole should be $\frac{1}{4}$ inch less than the length of the terminal exclusive of the conical end. To install the bond the hammer should be applied to the bosses on the outer surface of the terminal at first very lightly and gradually with increased force until the bosses have disappeared. Care should be taken to deliver the blows squarely on the bosses so as to avoid cutting the studs on the edge of the holes.

All twin studs are $\frac{1}{4}$ inch in diameter and are spaced $1\frac{1}{4}$ inches between centers. Bonds up to and including 250,000 C.M. conductor have studs $\frac{1}{4}$ inch long, and larger sizes have studs $\frac{1}{2}$ inch long.

FORM M TWIN TERMINAL BONDS

The Form M bond is for use on the outside of the head of the rail, the conductor extending down outside of the joint plate and between the center track bolts. The conductor consists of specially wound cable providing great flexibility, and as it emerges from the terminal in the direction of the maximum movement of the joint the bond is exceptionally durable.

Form M1 Bond on Rail

Form M3 Bond on Rail

Form M1 bonds may be used on all joints where the distance between the two inner track bolts is such as will not interfere with the U-shaped conductor. The developed length is measured from center to center between studs when the conductor is straight and extended.

The conductor of the Form M3 bonds emerges from one side of the terminal and is used on joints having very short spacing between the inner track bolts as found on some six-bolt rail joints.

FORM M TWIN TERMINAL BONDS

The Form M2 bond has terminals like those of the Form M1 bond and is made in any required length of conductor. It is used for cross bonding and spanning long distances.

CONCEALED BONDING

This method permits the use of bonds having a length which will give the most efficient service for a given cross section of bond conductor. The minimum length of either ribbon or cable bonds to give thoroughly good results is shown in the following:

Conductor Section	Length in Inches Between Centers of Terminals	Conductor Section	Length in Inches Between Centers of Terminals
0	8	250,000	10
00	8	350,000	12
000	9	400,000	13
0000	10	500,000	16

Bonds of the foregoing lengths will fit any rails having the standard bolt spacing usually found on A. S. C. E. rail sections, and will give long life under all ordinary conditions. On roads having exceptionally heavy rolling stock or where the character of the roadbed is such as to allow considerable movement of the joints, a bond of slightly greater length should be used.

Tucking. The ribbon and divided cable bonds are provided with tuckings of liberal dimensions so that the bond will readily yield with the movement of the joint either longitudinally from expansion or contraction of the rail or vertically from the weight of passing cars. The tucking is generally located at a point on the bond coming opposite the rail ends. For single bonding the tucks will be exactly halfway between the terminals. When two bonds are generally staggered, making it necessary to offset the tucking from the center of the bond, the tucks one inch from the center of the bond gives proper clearance.

Spread. The divided conductor bonds are made with the two branches spread or separated to a dimension to permit clearance for the track bolts. The standard bonds are spread so as to span bolts $\frac{1}{4}$ inch in diameter, but where larger bolts are used, bonds with a greater spread are supplied as may be required.

Unbalancing. In many sections of rail the bonding space beneath the joint plate is unequally distributed above and below the joint bolt plates and therefore will not accommodate bonds in which the conductor

Form M2 Twin Terminal Cable Bond

bonds per joint are used they are generally staggered, making it necessary to offset the tucking from the center of the bond, the tucks one inch from the center of the bond gives proper clearance.

RAIL BONDS

CONCEALED BONDING—Concluded

branches are of equal rectangular or circular sections. This condition is common to all A.S.C.E. T rail sections with standard joint plates of 85 lbs. per yard and smaller. When ribbon bonds are used this condition is met by *unbalancing* the conductor; that is, by having more ribbons in the lower branch than in the upper, and, when cable bonds are used, by pressing the conductor branches approximately to a triangular section, thus providing for the maximum of clearance.

FORM F CABLE BONDS

The conductor of the divided cable bond adopted for use under joint plates is especially designed to give the greatest possible flexibility, and thereby withstand the destructive tendency of joint movements, thus ensuring a long life to the bond. The tuckings are of liberal dimensions and provide ample flexibility for the longitudinal movement of the rails.

Section of 70 lb. A. S. C. E. Rail with Standard Joint Plates, Showing 4/0 Bond with Round Cable Conductors in Dotted Lines and Pressed Cable Conductors in Solid Lines

T Rail Bonded with One Form F9 Bond

Form F bonds can be supplied having either solid or tubular terminals and when specially ordered the terminals are tinned.

In general it is found that only the large girder rails and large T rails have proper clearances for the balanced bond, and that the medium and smaller sizes of T rails have restricted space above the track bolts and require a conductor of another shape. Unbalancing of the conductors, readily accomplished in a ribbon bond, is not practicable with a divided cable bond because the cable is not so compact as the flat wire conductor and when a sufficient number of wires are transferred from the upper to the lower conductor to obtain the requisite clearance for the upper branch, the lower branch is too large to fit into the space below the bolts without being badly pinched between the rail and the plate. This pinching will very materially shorten the life of the bond, as the conductor is not free to move.

Form F9 Solid Terminal Cable Bond

Numerous tests have shown that pressing a conductor does not lessen its life but on the contrary increases it, since stiffening the pressed portions tends to confine all vibrating movement to the center of the bond, where the conductor is so formed as to best withstand vibration, and thereby actually increases its life. It is possible to bond 60 lb. rails with a 4/0 bond in this form and have satisfactory working clearances.

Form FT9 Tubular Terminal Cable Bond

The Forms F9 and FT9 bonds have conductors equally divided in the upper and lower branches pressed into approximately a triangular shape, thereby affording proper clearances on medium sizes of T rails having restricted space above the track bolts. The tucking is located at the center of the bonds.

RAIL BONDS

Form F-10 Solid Terminal Cable Bond

Form FT-10 Tubular Terminal Cable Bond

The conductors of Forms F-10 and FT-10 bonds are equally divided in the upper and lower branches and the tucking is offset from the center of the bond. These bonds are used in double bonding medium size T rails when the bonds are placed one on each side of the rail and the terminals are staggered necessitating the offsetting of the tucks so as to avoid interference with the insertion of the track bolts or the terminal of the second bond.

Unless otherwise specified the tucking is offset one inch from the center of the bond as this is found suitable for most conditions.

Form F-5 Solid Terminal Cable Bond

Forms F-5 and FT-5 bonds have conductors equally divided in upper and lower branches and the tucking is located in the center of the bond. The conductor consists of many fine strands all wound in the same

Form FT-5 Tubular Terminal Cable Bond

direction with a short pitch. This form of bond is adapted to single bonding, large girder and T rails or the medium sizes of T rails with special joint plates.

In double bonding large girder rails with two rows of track bolts the balance bond with round conductors will usually be found to give proper clearances.

FORM A RIBBON BONDS

The ribbon bond is particularly adapted to use under joint plates where the restricted space demands extreme compactness of design. The conductor of this bond is composed of thin copper ribbons with the greatest width in the horizontal plane, thus affording maximum flexibility in the vertical plane or in the direction of the greatest movement of the joint. The tucking of the conductor provides flexibility for the longitudinal movement of the rails.

Ribbon bonds can be supplied having either solid or tubular terminals and when specially ordered the terminals are tinned.

The conductor is usually unbalanced with about one-third in the upper branch and two-thirds in the lower. Thus a 4/0 bond for a 80 lb. A.S.C.E. rail with standard joint plates has 10 ribbons in the top branch and 18 in the lower branch. The terminals are usually located halfway between the first and second bolt holes.

T Rail Double-Bonded with Form AT-8 Ribbon Bonds Spanning Both Inner Bolts

Railway Material

RAIL BONDS

FORM A RIBBON BONDS—Concluded

Form A7 Solid Terminal Ribbon Bond

Form AT7 Tubular Terminal Ribbon Bond

Forms A-7 and AT-7 unbalanced, center-tucked bonds having unequally divided conductors and the tucking located in the center of the bond are especially suitable for bonding T rails having greater space below the track bolt than above.

Form A8 Solid Terminal Ribbon Bond

Form AT8 Tubular Terminal Ribbon Bond

Form A-8 bonds are similar to the Form A-7 excepting that the tucking is offset for double bonding. For the standard track bolt drilling, offsetting one inch from the center of the bond will locate the tucking at a point opposite the ends of the rails and avoid interference with the track bolts.

In selecting a ribbon bond it is generally found that only the large girder rails and the larger sizes of T rails provide space for the balanced bond. There are several patented joint plates which provide the necessary clearance for this form of bond on rails of the medium sizes, but ribbon of special width is required.

Form A5 Solid Terminal Ribbon Bond

Form AT5 Tubular Terminal Ribbon Bond

On all sizes of T rails up to 90 lbs. per yard, A. S. C. E. sections with standard joint plates, an unbalanced bond is necessary to obtain proper clearances.

The standard bond ribbon used in all bonds under 250,000 C.M. is 0.19 inch wide by 0.032 inch thick.

RAIL BONDS

FORM A RIBBON BONDS—Concluded

Girder Rail Bonded with Two Form A-5 Ribbon Bonds Spanning Both Inner Bolts

Forms A-5 and AT-5 bonds have conductors equally divided in upper and lower branches and the tucking is located in the center of the bond. They are particularly adapted for single bonding large, girder and T rails. The balanced bond can also be used on ordinary T rails having special joint plates or on many of the patented joints. In double bonding large girder rails with two rows of track bolts, the balanced bond will usually be found to give proper clearances.

FORM B RIBBON BONDS

Form B bonds may be used on rails where the inner track bolts are located so as to permit drilling of the bond holes between the ends of the rails and the first bolt holes.

T Rail Bonded with One Form B Bond

The length of this bond must necessarily be short, but the reverse tuck provides some flexibility. This bond is not recommended for permanent installations, but is useful for temporary work around mines, quarries and similar places, where the rails are frequently shifted and the bond destroyed. It is an efficient bond at low cost for this class of work.

FORMS D AND DT STUB END CABLE BONDS

Stub end cable bonds are useful in bonding the various parts of special track work to the main bond around such special work.

Form D Solid Terminal Stub End Bond

Form DT Tubular Terminal Stub End Bond

A stub end bond has but one terminal and a short length of conductor, usually 12 inches long, but can be supplied in any length.

FORMS E AND ET STUB END SOLID WIRE BONDS

Stub end solid wire bonds also are used for bonding the various parts of special track work to the main bond around such special work.

Form E Solid Terminal Stub End Bond

Form ET Tubular Terminal Stub End Bond

Such a bond has but one terminal and a short length of conductor, usually 12 inches long, but can be supplied in any length.

TWIN STUD TERMINAL BONDS

Twin terminal bonds are measured from a point in the center of a line drawn through the center of the two studs to the same point in the other terminal when bond is straight and extended.

The list price of twin terminal bonds is based on the largest size terminal scheduled for bond of equivalent cross section and length.

Conductor Section	Length in Inches	Net Wt. in Lbs. per 100	List Price per 100
00	7	61	\$55.30
0000	7	85	66.50
0000	$7\frac{1}{2}$	$87\frac{1}{2}$	67.75
0000	8	90	69.00
0000	$9\frac{1}{2}$	$97\frac{1}{2}$	73.50
250,000	8	118	79.00
300,000	8	128	89.80
350,000	$7\frac{1}{2}$	$138\frac{1}{2}$	97.50
350,000	8	143	100.00

Form C Foot Bonds

Add to schedule list price the following:

Up to and including 350,000 cir. mils. \$20 list per 100.

Over 350,000 cir. mils. including 500,000 cir. mils. \$25 list per 100.

Over 500,000 cir. mils. \$30 list per 100.

Bonds with Tinned Studs

For tinning any standard type stud terminal bond, including twin stud, add \$3 list per 100 bonds.

Bonds with Extra Large Terminal Cap

Those having soldering in addition to compression, add \$7 list per 100 bonds for stud of $\frac{3}{8}$ inch diameter and smaller; for those having terminal diameters larger than $\frac{3}{8}$ inch, add \$10 list.

Railway Material

RAIL BONDS

Separate Bond Terminals

Separate bond terminals are furnished drilled and tinned for soldering to the conductor, which may be scrap trolley wire or feeder cable. They are useful in bonding special work where many different distances are to be spanned. Form K-1 terminals have shanks parallel to the web of the rail while the shanks of the Form K-2 terminals are at right angles to the web of the rail.

**Form K-2
Solid Separate Terminal**

Form K-1 Solid Separate Terminal

Form KT-1 Tubular Separate Terminal

**Form KT-2
Tubular Separate Terminal**

350,000 C.M.	1	1 1/2	1/4				

No. 17315

Application of Channel Pins

Channel Pins

Channel pins are not recommended for permanent bonding, but are occasionally useful for temporary work. They are made with a straight groove deep enough to avoid cutting the wire in driving. The pins are taper pointed and slightly larger than the hole, so that when driven they envelop the wire and make a solid joint. The pins are made of soft steel, copper coated.

List No.	Diameter of Pin in Inches	Diameter of Hole in Inches in Which Pins Fit	Size of Wire	Approx. Net Weight in Lbs. per 100	List Price per 1000
134175	1/4	1/4	6	20	\$10.00

RAIL BOND COMPRESSORS

No. 68935

No. 103485

No. 61041

Double Screw Compressors

All of the Double Screw compressors are of the same design, and differ only in size and the amount of pressure they exert. The distribution of the metal in the frame is such as to make the machines strong and substantial, and as light as is practicable.

After the terminal has been inserted in the hole and the compressor mounted on the rail, the inner screw is centered in the depression in the bond terminal. The outer screw is then drawn up with the hand wheel until it rests against the rail web, thus holding the machine rigid and drawing the bond head up tight against the opposite side of the web. Compression is then effected with the wrench on the inner screw.

The end of the compressing screw is so designed that the hole in the rail must be completely filled with copper before the terminal can be riveted or button-headed over the hole.

The handwheel may be detached easily and discarded when work is to be done in limited space, as over ties, as the outer screw is provided with a hexagonal end to take a wrench.

The compressing power of these machines is from 20 to 30 tons.

List No. 68935 is designed to take the lighter rails up to 40 pounds. It has a vertical adjusting screw to center the compressing screw in the depression in the bond terminal. Power exerted, 15 tons.

All compressors are furnished with operating wrench. Extra wrenches may be ordered by List Number.

List No.	Used With	Diameter of Terminal up to	Top of Jaw to Center of Screw	Approx. Net Weight in Lbs. Each	List Price Each
61040	T rails, 5 ins. and under	$\frac{3}{4}$ in.	$3\frac{3}{4}$ ins.	51	\$50.00

No. 40294

No. 40296

Screw Compressors for Foot Bond

This compressor is used for installing the Form C Beveled Head Foot Bond. The bond holes are drilled or punched at right angles to the upper surface of the foot of the rail.

List No.	Description	List Price Each
40294	Foot Bond Screw Compressor, weight 80 lbs.	\$90.00

Hydraulic Foot Bond Compressor

It is intended for the installation of Form C Beveled Head Foot Bonds. The holes in the rail are tapered with the large aperture at the top; the bond terminals are inserted from beneath the rail, and compressed backward against the taper, forming an absolutely watertight and flush joint, and a perfect contact.

40296	Hydraulic Conductor Bond Compressor, weight 135 lbs., capacity 35 tons.	\$400.00

Delivery F. O. B. Factory, Schenectady, N. Y.

RAIL BONDS. INSTALLATION TOOLS

Electric Grinder

Rail Grinding Machine
Duntley Portable Electric Grinder
For 460 to 600 Volt Circuits

For grinding rails for bonds, either soldered or otherwise fastened.

 The grinder carries an emery wheel 8 inches in diameter, and $\frac{3}{8}$ inch face. The speed of the tool is 3900 R.P.M. and the weight complete is 28 lbs. It is regularly equipped with an 8 inch in diameter by $\frac{5}{8}$ inch face emery wheel, and two 20 feet lengths of cable attached to the grinder. The switch is mounted on the machine within easy reach of the hand.

List No.	Description	Wt.	Each
103477	Portable Electric Grinder	28 lbs.	\$180.00
	Extra wheels 6 in. in diameter, $1\frac{1}{4}$ inch face, $\frac{3}{8}$ in. hole	6 lbs.	2.30

BUDA HYDUTY PAULUS TRACK DRILL AND REPAIR PARTS

Repair Parts

Paulus Track Drill

Buda Hyduty Paulus Track Drill

The Paulus Track Drill has proved to be a most satisfactory hand-operated upright machine for drilling rails. It is provided with an automatic feeding device that requires no attention. A dog connecting ratchet on the feed screw is operated by an eccentric which is put in motion by the revolving spindle and results in as coarse a feed as is consistent with the best results from a point of view of time and of safety to the bit. Spindle takes drills with round straight shanks.

List No.	Description	Approx. Net Weight in Lbs.	List Price Each
156508	Paulus track drill for T rails	75	\$45.00
156509	Paulus track drill for girder rails	80	50.00

LOVEJOY TRACK DRILL (PAULUS PATTERN)

This track drill is substantially built and well adapted to hard usage. It has crucible steel gears and forged steel hooks. The hooks are shaped to permit drilling of holes as close as $\frac{1}{2}$ inch to the end of the rail. and are adjustable lengthwise to extend over a Weber joint or a guard rail. The hooks may be adjusted to the height of the rail by a set screw. To clear the track it is necessary only to break the back brace and throw the hooks backward. Spindle takes drills with round straight shanks.

RAIL DRILLING MACHINES

Motor Drills

Double-Twin Drill Operated by Electric Motor

The motor is extremely light and compact, and it will operate directly on a 500 volt trolley circuit. The internal windings are thoroughly well protected and insulated, and the armature shaft is geared direct to the drill spindles. A device, not shown, for correctly and easily sharpening the drills can be attached to the motor.

List No.	Description	Wt. in Lbs.	List Price Each
103471	Motor-operated double-twin spindle drill....	280	\$650.00

Double-Twin Spindle Drill

Double-Twin Spindle Drill

This machine is designed to drill all four holes at one time in the head of T rails for the Twin Stud Terminal Bond. The machine is easy to handle and operate, and it works rapidly and accurately. It has a positive automatic feeding device, which can be adjusted within wide limits. The drills are operated by a lever, each stroke of which rotates the drills through a positive mechanism which provides equal rotation for all drill points.

Each spindle is provided with an adjusting sleeve so that each drill may be set independently of the others. This provision offsets uneven wearing or setting of rails and disalignment of rails on curves. Each machine is equipped with a gauge for determining the depth of the holes. Frames can be raised or lowered quickly to bring the holes into their correct positions. The machines are attached to the rails and operated without disturbing rail joints. The drill points are held rigidly in the machine and seldom break or chip. For the same reason the desired holes may be started without first prick punching the rail.

The levers by which the machines are operated are detachable so that the tools may be removed easily from place to place.

Each drilling machine is equipped with all fittings and one complete set of new drills. Many parts of these machines are interchangeable and small parts may be ordered by mail.

List No.	Description	Approximate Net Wt. in Lbs. Each	List Price Each
103470	Hand-operated double-twin spindle drill.....	125	\$300.00

Special Twist Drills

These drills are made especially for the double-twin spindle drill and are uniform in size, being $\frac{1}{2}$ inch in diameter by 6 inches long. The drills give very good results without lubrication if they are properly sharpened.

103472	Special $\frac{1}{2}$ in. twist drill.....	\$0.70

TRACK DRILLING AND PUNCHING DEVICES AND ACCESSORIES

Hand Ratchet with Round Taper Socket

Many methods are employed for drilling bond holes in rails. Without definite knowledge of the amount of work and the conditions under which it is to be performed, it is difficult to recommend the style of machine to employ. The intention in compiling this information has been to give data on a complete line of devices generally used for drilling, from the simplest hand ratchet to the more elaborate power drills.

In many cases bond holes are punched or drilled in rails at the rail mills. It is important that such holes be reamed bright before the bond is applied.

THE CENTURY FIELD AND ARMATURE TESTERS

New Century Field Tester

The Century Armature Tester

New Century Field Tester

The **New Century Field Tester** is for the special purpose of testing the fields and armatures of the electric railway types of motors. It instantly detects and locates short circuits, and grounds, in both field coils and armatures. When testing fields the readings are obtained by sliding the pointer knot along the scale to the point where two distinctly separate sounds in the receiver become as one. The armature test is a bar to bar test with the telephone receiver and contact fork. This instrument consists essentially of two small transformers with special primary and secondary windings and a sliding scale for registering the adjustment of each. The instrument is mounted in a mahogany box and is made very strong and durable.

List No.	Size	Wgt. Lbs.	List Price Each
323311	New Century Field Tester..... $6\frac{3}{4} \times 8\frac{1}{2} \times 14\frac{1}{4}$ ins.	12	\$160.00

The Century Armature Tester

The armature tester is operated in connection with either alternating or direct current lighting circuits. A hard rubber knob with knurled edge permits changing over from one kind of current to the other. It quickly detects and exactly locates wrong connections, shorts, opens and grounds without raising the leads or disturbing the hoods. We recommend it for power plants, manufacturers of motors and generators and repair shops of every description. It will test any armature that is equipped with a commutator, no matter how small or how large it may be.

List No.	Size	List Price Each
323312	Century Armature Tester..... $7 \times 9 \times 14\frac{1}{2}$ ins.	\$130.00

Type "A" Mine Insulator
Railway Material

Wiring Devices

The following are some of the different types of conductors that can be used for telephone and signal wires in mines:

Circular loom cable having conductors of No. 16 B. & S. copper or copper steel wire.

Nos. 12 and 14 B. & S. gauge bare or rubber-covered hard drawn copper wire.

No. 14 B. & S. gauge bare or rubber-covered copper steel wire.

Nos. 10 and 12 B.W.G. BB galvanized iron wire (bare or insulated).

For further information, see Miscellaneous Supplies Bulletin.

Sackett or Type "A" Mine Insulator

The Type "A" Mine Insulator is of the self-locking, self-draining type. The pin is first driven into the roof or wall of mine and insulator is then slipped over end of pin and given a quarter turn, which securely locks it in position. The insulator is white porcelain; the pin is malleable iron and non-breakable.

Price on application.

ELECTROSE INSULATORS

Electrose Standard Globe Strain Insulators

The No. 17221 has $\frac{1}{2}$ inch, and the Nos. 3322 and 17235 have $\frac{3}{4}$ inch malleable iron terminals.

Electrose Third-rail Insulators

Electrose Third-rail Insulators have been designed along lines that fully meet the requirements of modern railway practice. They possess the highest electrical and mechanical values. The regular and N. Y. C. types are made up of two separate parts securely locked together. The overhead and trench types are made up in one piece.

We are prepared to quote promptly on special types of third-rail insulators.

No.	Type	Height to Base of Rail	Width of Rail Support	Width of Base	Length of Base	List Price per 100
9006	Regular for 16 lb. rail	3 ins.	2 $\frac{1}{2}$ ins.	2 ins.	4 $\frac{1}{2}$ ins.	\$170.50
9007	Regular for 25 lb. rail	3 ins.	3 ins.	2 $\frac{3}{4}$ ins.	5 ins.	217.80
9008	Regular for 30 lb. rail	3 $\frac{1}{2}$ ins.	3 $\frac{1}{2}$ ins.	3 ins.	5 $\frac{1}{2}$ ins.	253.00
9009	Regular for 45 lb. rail	4 ins.	3 $\frac{1}{2}$ ins.	3 $\frac{1}{2}$ ins.	6 $\frac{1}{2}$ ins.	290.40
9010	Regular for 60 lb. rail	4 $\frac{1}{2}$ ins.	4 $\frac{1}{2}$ ins.	4 ins.	7 ins.	326.70
9011	Regular for 80 lb. rail	5 ins.	5 $\frac{1}{2}$ ins.	4 $\frac{1}{2}$ ins.	7 $\frac{1}{2}$ ins.	363.00
9012	Regular for 100 lb. rail	5 $\frac{1}{2}$ ins.	5 $\frac{1}{2}$ ins.	4 $\frac{1}{2}$ ins.	8 ins.	453.20
9001	N. Y. C. for 80 lb. rail	5 ins.	5 $\frac{1}{2}$ ins.	4 $\frac{1}{2}$ ins.	4 $\frac{1}{2}$ ins.	53.20

Notes: Bases can be furnished in various heights.

No. 9003 illustrates one of our types of overhead third-rail insulators (under contact); diameter of hood 7 $\frac{1}{2}$ ins., height 3A ins., diameter of stud $\frac{3}{4}$ ins.

No. 9005 is provided with a pinhole adapted for receiving the cement for securing the pin into operative position; also furnished with threaded pinhole so that the insulator may be screwed on to a threaded metal pin, thereby avoiding the use of cement. Diameter 4 $\frac{1}{2}$ ins., overall height 4 $\frac{3}{4}$ ins.

ELECTROSE INSULATOR ACCESSORIES

No. 94424

No. 94424. Sectional View

Electrose "Ideal" Locking Cap and Cone (PATENTED)

The "Ideal" cap is provided with a heavy malleable iron protecting ring thoroughly imbedded in the electrose composition. This prevents the cap from breaking if carelessly installed and protects the cap from injury from blows of the trolley pole. The metal ring also permits the suspension to be readily disconnected and removed, when desired, without injury to the cap. The cone is threaded and when in position it locks the cap, suspension body and cone together and effectually prevents the line from dropping by the unscrewing of the cap, due to vibration. Both the Ideal cap and cone are interchangeable with all standard suspensions of this type. The Ideal cap can be quickly installed by the use of an ordinary monkey or regular cap and cone wrench.

List No.	Description	List Price per 100
94424	Ideal cap and cone, $\frac{5}{8}$ in. stud.	\$40.25
94425	Ideal cap and cone, $\frac{3}{4}$ in. stud.	47.30

Electrose Regular Cap and Cone

Many years of service have proven the reliability of this form of suspension. The grade of electrose insulation employed for caps and cones is guaranteed to withstand the highest temperatures encountered in actual service. It is hard, tough and strong and has a highly polished surface. The bolt is made of malleable iron.

List No.	Description	List Price per 100

 Railway Material

STANDARD SHELBY TROLLEY POLES

Standard "A" Pole

Standard "B" Pole

Shelby Trolley Poles

These poles are made of high-grade seamless steel tubing. Prior to the last cold drawing operation the material is given a special heat treatment which leaves the grain in the finest condition. The elastic limit of the material in the finished pole is from 60,000 to 70,000 lbs. per square inch. Both Standard A and B poles are reinforced at the butt with No. 13 gauge tubing and differ only in the length of this reinforcement. Standard A pole is suitable for all standard service. Standard B is designed to meet the most severe conditions and is approximately 50 per cent. stronger and 20 per cent. heavier than the A pole.

SECTIONAL POLES

Tubular Steel Poles

Tubular steel trolley poles are made up of two or more sections of standard or extra heavy steel tubing. The diameters of sections given refer to the nominal inside diameters of standard pipe in accordance with the table given below.

Three section poles are generally recommended for trolley line construction. Two section poles are used for electric light telephone and telegraph work.

Ground line protecting sleeves consist of a length of pipe, usually 24 inches long, one size larger than the lower section of the pole. These sleeves are shrunk around the portion of the pole on a line with the ground, and greatly increase the life of the poles by preventing corrosion at what is invariably the first point to give way.

Special poles can be furnished in any length and made up of any standard sections to order.

Prices on iron poles depend upon market conditions and will be supplied upon application.

Tubular Steel Sectional Poles

Standard tubular steel poles for trolley wire suspension are made up of three sections of standard or extra heavy steel tubing. The safe load given is the maximum side strain that may be applied near the top without permanent deflection, based upon the poles being set 6 feet in the ground.

Trolley Wheel Bushings

These graphite bushings are made of special bearing metal and the graphite inserted in grooves by a patented process. They are self-lubricating and do not require oil or grease. Packed 50 in a box.

Holland Mine Harp

The Holland Mine Harp

The Holland Mine Harp has proved its ability to stand the severe tests of mine service. Note the contact to carry the current away from the bearing thus increasing life of trolley wheel. The current is taken from the harp through a cable connection which is cast a part of the harp, having one large opening with two set screws. The pole sleeve is long and is made in such a manner that the pole is firmly held and reinforced.

KALAMAZOO TROLLEY WHEELS

The Kalamazoo Trolley Wheel is made of pure lake copper, treated by a special process which gives it the quality of softness combined with a remarkable degree of toughness. The result is a wheel which has extraordinary durability and yet which causes no injury or wear upon the overhead wire. In this wheel there is not an ounce of scrap brass, of which the common brass wheel is composed, nor any of the common alloys so easily affected by the arc drawn from the wire. Only pure ingot metal is used, which produces only a high-grade wheel. The oiling device is something entirely novel and insures thorough lubrication, thus effecting a great saving in bushings.

HOLLAND TROLLEY HARPS

The harps illustrated below possess a special feature over ordinary harps in that the current is taken from the side of the wheel through the inside of the harp instead of through the hub and bearing. The contacting surfaces are large and durable. The harps are reversible and have a trolley rope fastening on each side. They are designed to absolutely prevent any fouling of the wire when being handled by the operator.

The axle can be filled with lubricant through one end if desired without removing the axle or hub or any screws.

Matthews' "O.K." Sleet Cutters

The Matthews "O.K." Sleet Cutter is a practical device for removing sleet from the trolley wire. It may be used without removing the wheel. It consists of a Y shaped malleable iron casting, fitted to which is a soft brass contact lug, which is fastened by means of ordinary copper rivets. This lug when worn may be easily replaced. In attaching, the lower part of the sleet cutter is set against the harp and under the wheel and is clamped firmly thereto by means of an iron lug, washer and nut, as shown in the illustration.

List No.	Description	List Price Each

HOLLAND TROLLEY BASES
BALL BEARING TYPE NO. 5

This trolley base is designed for city and light interurban service. Four large oil holes or grease chambers are provided for lubrication. The base is sensitive and free acting and is provided with locking down device. It will take quick and sharp curves.

Data: Height extended $3\frac{1}{2}$ inches. Length—normal 38 inches. Extended 48 inches. Radius of swing $31\frac{1}{2}$ inches. Diameter of base $12\frac{1}{4}$ inches. Bearings $7\frac{1}{8}$ inches. Pole socket $9\frac{1}{2}$ inches. Weight 90 lbs. Tension 10 to 50 lbs. Bearings—22 one-inch balls.

List No.	Description	List Price Each
5	Holland ball bearing base....	\$40.00

No. 5

BALL AND ROLLER BEARING TYPE NO. 7

This trolley base is constructed with a sub-base the same as the Holland anti-friction pin plate. The bearing device consists of 15 hardened steel rollers and $8\frac{3}{4}$ inch balls, and a grease chamber $\frac{3}{8}$ inch deep is provided in the base. Simple locking down device.

Data: Height over all 17 inches. Length—normal 28 inches. Extended 40 inches. Diameter of pin plate 12 inches. Pole socket 10 inches. Side rods $1 \times \frac{1}{2}$ inches. Weight 110 lbs. Tension 10 to 50 lbs.

List No.	Description	List Price Each
7	Ball and roller bearing base...	\$36.00

No. 7

PLAIN PIN TYPE NO. 9

This base is provided with base consisting of a hardened cold rolled steel pin encased in $\frac{1}{4}$ inch brass bushing, allowing free play. The bushing is provided with numerous holes for lubricant and may be readily replaced when worn. The base is furnished with a simple but strong Holland pole clamp lock down device, strong spring and side rods.

Data: Height over all 17 inches. Length—normal 28 inches. Extended 40 inches. Diameter of pin plate 12 inches. Radius of swing 22 inches. Pole socket 10 inches. Weight 95 lbs. Tension 10 to 50 lbs.

List No.	Description	List Price Each
9	Plain pin type base.....	\$30.00

No. 9

BALL BEARING TYPE NO. 4

This base is one of extremely small clearance and is especially adapted for railways operated under conditions requiring a base of minimum clearance. Pole clamp and lock down device are provided. The two compression springs act as a cushion if trolley is thrown from the wire and so prevent injury to the base.

Data: Height extended $2\frac{3}{4}$ inches. Length—normal 40 inches. Extended 54 inches. Diameter of pin plate 12 inches. Bearing $13\frac{3}{8}$ inches, consisting of 42 one-inch balls. Radius of swing 30 inches. Pole socket 12 inches. Weight 120 lbs. Tension 10 to 50 lbs.

List No.	Description	List Price Each
4	Holland ball bearing base....	\$44.00

No. 4

HOLLAND TROLLEY BASES

No. 3

BALL BEARING TYPE NO. 3

This base is the most substantial offered to the trade, and is especially adapted for the heaviest service. It is single acting and reversible, the fulcrum being arranged to give full tension at working point, but little tension as pole approaches horizontal. The bearing consists of forty-two one-inch balls and is self-cleaning, dust and water promptly working out at the bottom.

Data: Height, extended, 7 inches. Diameter, base, 16 inches; bearing, $13\frac{1}{2}$ inches; pole socket, 24 inches; weight 100 lbs; tension 15 to 50 pounds.

List No.	Description	List Price Each
3	Holland Ball Bearing Base...	\$44.00

MINE BASE NO. 18

This base is used on mine cars and on bonding and track machine cars for street railways. The base is made either with angle fastening plate (as shown) for attachment at side of car, or with flat plate base for top of car. When ordering, type of fastening plate should be specified.

Data: Height, extended, 7 inches; diameter, fastening plate, 8 inches; pin plate, 12 inches; weight 95 pounds.

List No.	Description	List Price Each
18	Holland Mine Base.....	\$36.00

No. 18

ANTI-FRICTION PIN PLATE NO. 24

The Holland Anti-friction Pin Plate is a sub-base to be used with standard Nos. 1, 3, 5, 6 and 8, converting an ordinary base into a ball bearing base at less than half the cost of a new base. It has fifteen hardened steel rollers and eight $\frac{3}{4}$ inch balls. The current is taken directly from the surface of the base and does not pass through the bearings. Lubricant is stored in a covered chamber of sufficient size to hold a six months' supply.

List No.	Description	List Price Each

TROLLEY CORD AND FITTINGS

Samson Spot Waterproofed Cord

This trolley rope is the highest grade, being constructed of extra quality yarn, tightly braided, and thoroughly waterproofed by a special process. It is uniform in size and smoothly finished. It will not stretch, shrink, or swell like ordinary trolley cord, and is particularly recommended for use with trolley catchers and retrievers. It is furnished in coils of approximately 1200 feet.

Railway Material

GEARS FOR RAILWAY MOTORS

Cast and Forged Gears

The following listed gears are for both General Electric and Westinghouse motors. Special care is taken to see that the specifications, as issued by the Committee of Maintenance of the American Street Railway Association, are rigidly adhered to.

Cast Steel Gears. These are cast at a selected steel foundry, where special heats are made for gear castings. They are practically free from blow holes; thickness of teeth is carefully checked by gauge, and every gear is run in both directions in a testing machine. Gears for use with motors of 75 H.P. capacity and over are made of a higher carbon content than is generally used, and afterward annealed in special annealing ovens. By this means higher physical properties are obtained and all shrinkage strains eliminated. To insure full strength in the spokes of solid gears, ribs are cast in the sides, and a general endeavor has been made to so distribute the metal that all parts of the gear are as nearly of one thickness as is possible.

Rolled or Forged Gears. Made from homogeneous forged blanks by an improved process which insures for this type of gear high physical characteristics and freedom from piping and segregation. The inherent advantages of this process are impossibility of blow holes, sand spots or shrink strains, and relatively high physical characteristics resulting from the rolling operation.

Gears are offered in the following grades:

- Grade D. Rolled or forged steel solid gears, untreated.
- Grade F. Rolled or forged steel solid gears, oil treated.
- Grade K. Rolled or forged steel solid gears, armorized.
- Grade L. Cast steel split or solid gears, armorized.

Untreated cast steel, split or solid gears do not have grade letter.

Prices on application.

Railway Motor Pinion

Gear Cases

Railway Motor Pinions

The listed pinions are for both General Electric and Westinghouse motors. Special care is taken to see that the specifications, as issued by the Committee of Maintenance of the American Street Railway Association are rigidly adhered to.

Pinions are manufactured with the same careful attention to detail as the gears.

Pinions are listed in three grades.

Grade H. Oil treated. Recommended for use with motors up to 75 H.P. capacity. While the prices of these pinions are only slightly in advance of the common untreated ones, the wearing qualities and physical characteristics are far in excess of same.

Grade F. Oil tempered and specially recommended for all motors of 75 H.P. capacity and over. They are noted for their long life, high physical characteristics, and great toughness, the oil treatment considerably increasing both the physical properties and toughness.

Grade K. Armorized pinions for use with armorized gears.

Note: Unless otherwise specified, orders for pinions for motors smaller than 75 H.P. will be filled with Grade H, and for motors of 75 H.P. or over with Grade F.

Prices on application.

G. E. Malleable Iron Gear Cases

The gear cases are malleable iron castings with supporting brackets cast together with one or both halves. Owing to the thin section of the cases and the relatively heavy section of the supporting brackets the production of castings for these cases is a difficult matter and requires a high degree of perfection of foundry practice. The greatest care is exercised in the inspection of all castings in order to insure freedom from shrinkage, cracks in the supporting brackets, and distortion of shells.

The various cases are designated by List Nos. and also by symbol or drawing List Nos. All gear cases have stamped upon them either a symbol No. (as DE-6) or a drawing List No. (as DL-37902), and any gear case may be readily identified by reference to the List No. corresponding to the symbol or drawing List No. stamped on it.

A table is shown which gives the maximum gear teeth and maximum pinion teeth which the case will accommodate and the related bulb diameter of the gear with which it may be used.

Prices on application.

Copper Segment

Copper Segment

Bearing Lining

Bearing Lining

Motor Commutator Segments

Commutator segments are made of hard drawn copper bars and the finest homogenous amber mica, from which all flint and other hard substances found in the natural mica have been removed.

Armature Bearing Linings

For G. E. Motors

In the design of railway motors for various classes of service, different types of bearing linings have been employed. In some cases the choice of type has been determined by the necessity for economy of space or other features of machine design; in others, operating conditions require a given type, but wherever possible the choice of one type or another is left to the customer as his operating conditions may indicate.

Thus where size of axle permits, axle linings for most motors are made both in Babbitt and bronze, and every effort is made to meet the requirements of service under all conditions.

BRASS LININGS

Brass or bronze linings are made of compositions which have been thoroughly tested during many years of service. Much cheaper linings can be made by the employment of cheaper mixtures. In fact, brass linings can be made for almost any price.

LUMEN LININGS

Lumen linings are made from a special patented alloy. It is a very excellent material for use under certain conditions, having in a certain degree the anti-friction qualities of Babbitt metal combined with sufficient strength to allow its use without a supporting shell where the housing allows room for sufficient thickness.

BABBITT LININGS

Babbitt linings are iron shells filled with Standard Railway Babbitt Metal.

BRASS AND BABBITT LININGS

Brass and Babbitt linings are bronze shells with a facing of Babbitt metal $\frac{1}{4}$ inch thick sweated to the brass. The shells are provided with dovetail grooves with which the Babbitt engages, and which serve to anchor it securely.

Axle linings with radius "A" are used with axles having larger diameter in gear fit than in motor axle bearings.

Axle linings with radius "B" are used with axle brackets which have angle rounded between bore and face.

Prices on application.

RAILWAY MOTOR PARTS

Cross Section GE-80 Field Coil

Armature Coil

Heat Proof Field Coil

Heat Proof Armature Coil

Mummy Coil

Motor Armature Coils for GE Motors

These armature coils are perfectly interchangeable, and fit accurately in the slot, which is necessary to avoid either abrasion in winding or destructive vibration in service.

The slot portion of all armature coils is molded in steam heated presses to exact dimensions and in no other way is it possible to provide against vibration in the slot and consequent deterioration of the insulation in service.

Except in bar wound coils for certain of the larger motors in which mica is employed, the insulation of the complete coil is accomplished by the use of varnished cambric manufactured expressly for the purpose.

Deltabeston Heat-proof Armature Coils

Heat-proof coils are wound with pure asbestos covered Deltabeston magnet wire and impregnated with a special compound having a melting point so high that it is not softened or affected by the maximum temperature reached by the coils in service.

The method of manufacturing gives an all-asbestos insulating medium of great mechanical strength and toughness, high dielectric strength and one which is practically unaffected under the severest operating conditions. Coils are of the correct dimensions to fit accurately in the core slots and have a decided advantage over cotton coils, in that they will not shrink in service, thus avoiding vibration in the slot and consequent deterioration or breaking down. Every armature coil is subjected to a number of tests before leaving the factory, and coils failing to pass all of these are immediately rejected. This method of inspection assures the customer of the receipt of perfect coils only.

Deltabeston Heat-proof Field Coils

Heat-proof coils are wound with pure asbestos covered Deltabeston magnet wire and impregnated with a special compound having a melting point so high that it is not softened or affected by the maximum temperature reached by the coils in service.

The method of manufacturing gives an all-asbestos insulating medium of great mechanical strength and toughness, high dielectric strength, and one which is practically unaffected under the severest operating conditions. Coils are of the correct dimensions to fit accurately, and have a decided advantage over cotton coils, in that they will not shrink in service, thus avoiding vibration and consequent deterioration or breaking down. Every field coil is subjected to a number of tests before leaving the factory, and coils failing to pass all of these are immediately rejected. This method of inspection assures the customer of the receipt of perfect coils only.

Motor Field Coils

For GE Motors

In the manufacture of wire wound field coils each turn is properly seated so as to avoid a burnout as a result of abrasion of the insulation by vibration.

The insulation of all wire wound coils consists of a special asbestos and cotton covering; the insulation between turns of ribbon wound coils is asbestos paper, so laminated as to prevent any danger of short circuit between turns by reason of impurities in the asbestos.

All coils, unless otherwise noted in the tables, are further protected by being impregnated, while in a vacuum, with an asphaltum compound which penetrates all the interstices of the winding, hermetically sealing the coil against the entrance of moisture and so improving its thermal conductivity that the heat generated is rapidly dissipated, thus considerably increasing the capacity of the coil.

Operating Handle Type

Operating Wheel Type

Reversing Handle

Contact Finger

Contact Finger

Controller Handles

For Type K Controllers

Controller handles are made from a special brass alloy or malleable iron forgings—depending on conditions of operation. Each handle has a List No. stamped or cast on it, to assist customers in ordering.

Contact Fingers

For Type K Controllers

Single Fingers

Many of these controller fingers have their List No. stamped upon them. Where this is impossible, fingers having the same List No. are assembled in a package and a tag giving List Nos. is attached.

INTRODUCTORY

Mica in its natural state possesses high insulating qualities, great thermal resistance and mechanical strength, but it lacks flexibility, and homogeneity. Micanite retains the virtues and overcomes the drawbacks of the original mica.

Micanite is obtained by dividing and subdividing the laminae of mica down to films of minute thickness, and then re-assembling these into a consistent whole. These exceedingly thin films of raw mica are stuck together by an insulating cement with the application of heat and pressure, the amount of cement, heat or pressure varying according to the exact quality of material it is desired to obtain.

The mica which we furnish can be classified under two general terms—white and amber; each possessing superior qualities for particular applications. The white is mined in India and the amber in Canada. In each country the Mfr. maintains organizations for the purpose of insuring the best selection of mica in the rough and for securing the greatest skill in the splitting of the laminae. The greatest vigilance is exercised in excluding all foreign matter from the mica films. Even after they are received in the factory the services of several men are required for the sole purpose of inspecting the mica as it passes before them on slow moving vibrating screens. The assembling of the laminae into sheets, the making of plate, tubes, commutator segments and rings and the innumerable articles of special shape and form, involving an infinity of detail, are subject to the most rigid inspection at each stage of manufacture.

Micanite Commutator Insulation

The first application of Micanite was for commutator segments. It was developed for that express purpose; not altogether from an economical point of view, but to provide a material possessing more plasticity than the raw mica, which was universally employed at that time.

If Micanite segments are cut to size from plate by our customers, a foot power cutter, bookbinder's shears or tinmith's shears, are poor tools to use. The edge of the Micanite is liable to be bruised. This may result in the dragging of the copper over the Micanite when the commutator is turned up in the lathe. Short circuits, or "near" short circuits, are often caused in this manner. The best tool is a fine toothed band saw with moderate set. All segments made to templet in the factory are cut in this manner.

After assembling the copper and Micanite segments with the aid of the usual clamp rings fitted with screws or with tapered compression rings, bake the assembled segments before turning the V part. Tighten moderately before baking. Bake long enough to bring every part of the assembled segments to a temperature of 350 degrees F. to 400 degrees F. Then tighten the commutator gradually as it cools, making it solid when nearly cold.

Micanite Commutator Rings

We furnish commutator rings, from the size required for the smallest fan motor, to the largest generator.

To facilitate description we illustrate below the most prevailing types. Some manufacturers prefer rings made up of separate parts, i.e., the taper ring fitted into the band ring. We advocate this method if sufficient distance is allowed between the apex of the metal ring follower, and the bottom of the V in the copper bars. This method also has the advantage in most cases of eliminating the cost of special molds, and that orders can be filled with greater promptitude. Separately fitted rings can be conveniently made up to 30 inches diameter. For larger commutators we advocate sectional V rings. These sectional V rings are made up of half thicknesses with the joints staggered.

V Ring, Solid

Sleeve Under Segments

Taper Ring, Straight

Taper Ring, Curved

Flat Ring

V Ring, Sectional

Tapered Band Ring

When the design of a commutator does not permit sufficient distance between the apex of the follower and the bottom of the V, we advocate the use of a solid V ring. We can furnish solid V rings up to 35 inches in diameter, but the molds for the larger diameters are very expensive. Ordinarily we do not advocate solid V rings of a larger diameter than 20 inches. For larger diameters it is economical to adopt the sectional V rings.

Empire Materials

"Empire" is the trade name given to the various oiled insulating materials prepared by the Mica Insulator Company. These materials include insulating cloth, paper, linen, silk and tape; and the word Empire may be understood to mean that only the most carefully prepared fabric is used as the carrier of the oil, and only the purest and cleanest oil used as the dielectric with which the fabric is coated.

The papers and cloths which we employ have been developed at very great expense and are prepared especially for us. The cloths are woven from long fibered yarn to give the highest tensile strength. They are given a special singeing and calendaring to remove all nap, and thereby reduce to a minimum the possibility of the oil film on the surface being penetrated by the cotton fibers. The cloth and paper are simply to serve as carriers for the oil film, and to give it mechanical strength. Their texture is such that there is also a thorough impregnation of the material by the oil. The insulation is provided by the oil. The oil is subjected to special treatment, which converts it, when dried, into a substance of great mechanical strength and tenacity, flexibility, long life, high specific resistance to both heat and electricity, and very high disruptive strength.

Railway Material

INDIA MICANITE PLATE

NO. 1 INDIA MICANITE PLATE

For Molding

No. 1 India Micanite Plate is made of very thin films of India mica cemented together with pure shellac and carefully surfaced to a uniform thickness.

When heated it becomes flexible and in that condition can readily be formed into such shapes as conical and band rings for commutators, troughs for armature slots, spools for magnets, and the thinner sheets rolled into tubes. Upon cooling it regains its rigidity. It is also used for flat work where high temperature is not a factor, such as transformer insulation, etc.

It is not intended for insulation between the copper bars of commutators, and must not be used for that purpose.

For commutator bar insulation we furnish special Micanite Plate.

Stock Thicknesses of 18 x 36 Inch No. 1 Plate

No. 1 Plate in standard size 18 x 36 inch sheets can be furnished of any special thickness at following prices:

.025 in. thick or over \$1.90 per lb. .024 in. thick or under \$2.38 per lb.

Sheets of special size or shape at slight increase over above prices.

NO. 11 INDIA MICANITE PLATE

For Molding

No. 11 India Micanite Plate is made of the same quality of India mica films and shellac that is used in the No. 1 plate, but is not quite as exact to thickness.

It becomes flexible when heated, is readily molded into form, and is suitable for all general purposes where a slight variation in thickness is permissible, except commutator segments. It is not intended for insulation between the copper bars of commutators.

.025 in. thick or over \$1.60 per lb. .024 in. thick or under \$2.04 per lb.

Sheets of special size or shape at slight increase over above prices.

NO. 2 INDIA MICANITE PLATE

For Commutator Segment Insulation

No. 2 India Micanite Plate is made of very thin films of India mica cemented together with the smallest possible amount of pure shellac, and carefully surfaced to a uniform thickness.

This plate is specially made to be cut into segments for insulating copper bars of commutators, and cannot be molded.

Stock Thicknesses of 18 x 36 Inch No. 2 Plate

Sheets of special size or shape at slight increase over above prices.

INDIA AND AMBER MICANITE PLATE

NO. 22 INDIA MICANITE PLATE For Commutator Segment Insulation

No. 22 India Micanite Plate is made of the same quality of India mica films and shellac that is used in the No. 2 Plate.

This plate differs from No. 2 only in that the variation of thickness is not confined to such close limits. In practice it gives admirable service for commutator bar insulation, but cannot be molded.

Stock Thicknesses of 18 x 36 Inch No. 22 Plate

Sheets of special size or shape at slight increase over above prices.

NO. 3 AMBER MICANITE PLATE For Commutator Segment Insulation

No. 3 Amber Micanite Plate is made of very thin films of Canadian amber mica cemented together with pure shellac and carefully surfaced to a uniform thickness. This plate is in every way identical with the No. 2 India Plate, except in the mica. This being Canadian amber, the plate is softer and presents less liability of failure to wear down evenly with the copper. For commutators containing a larger number of bars, or where the insulation is thicker than $\frac{1}{16}$, or where copper bars and brushes are softer than those usually employed, we recommend the use of No. 3 Plate instead of No. 2.

This plate cannot be molded.

Sheets of special size or shape at slight increase over above prices.

INDIA MICANITE PLATE AND CLOTH

NO. 4 INDIA MICANITE PLATE

This plate is made for flat work and for purposes where extreme accuracy of thickness is not important. It is suitable for all kinds of bases, round and square washers, and for all kinds of apparatus not subjected to high heat.

Its non-liability to fracture under extreme vibration is a valuable feature for marine work. It does not take a screw thread, but can be drilled and turned.

No. 4 Plate is not furnished thinner than $\frac{1}{8}$ inch.

Stock Thicknesses of 18 x 36 Inch No. 4 Plate

List No.	Approximate Thickness, Inches	Approximate Lbs. per Sheet	Average Punct. Voltage	List Price per Lb.
1296	$\frac{1}{8}$	2.95	50000	\$1.22

1302	$\frac{1}{2}$	25.7	400000	1.22

No. 4 Plate in standard size 18 x 36 inch sheets can be furnished of any special thickness at following prices:

$\frac{1}{8}$ in. thick or over \$1.22 per lb.

Sheets of special size or shape at slight increase over above prices.

NO. 5 FLEXIBLE MICANITE PLATE

No. 5 Flexible Micanite is made of very thin films of India mica cemented together with a special insulating cement of great flexibility and adhesiveness. This article in many ways presents mica in its most convenient and economical form for electrical insulation. It can be formed or bent to shape without the application of heat.

It is an excellent insulator for armature slots, armature, magnet and commutator cores, transformers, field coils, etc.

It can be stripped up into narrow widths, and when used in conjunction with Linotape makes a most efficient insulation for all kinds of conducting wires and cables.

Stock Thicknesses of 36 x 36 Inch No. 5 Plate

List No.	Approximate Thickness, Inches	Approximate Lbs. per Sheet	Average Punct. Voltage	List Price per Lb.
1303	.005	.575	2940	\$2.24
1304	.010	.967	5880	1.52

1314	$\frac{1}{8}$	12	73500	1.58

No. 5 Plate in standard size 36 x 36 inch sheets can be furnished of any special thickness at following prices:

.015 in. thick or over \$1.58 per lb. .010 to .014 in. thick \$1.52 per lb.

.009 in. thick or under \$2.24 per lb.

Sheets of special size or shape at slight increase over above prices.

NO. 20 MICANITE CLOTH

No. 20 Micanite Cloth is made with 1, 2 or 3 layers of high-grade India mica films, carefully cemented together with overlapping edges into sheet form, the sheet being faced on one side with cotton cloth and on the other side with Japanese paper.

It is an excellent composite insulation, and is often used in conjunction with Empire cloth and paper, fish paper, etc., for transformers, field magnets, armature cores, etc.

In strip form it is an efficient mica insulation for wrapping all sorts of conductors. When applied in this manner it is usual to bind it in position with Linotape or the ordinary friction tape.

Any special thickness or size of the above materials made on order.

NO. 26 ROPE PAPER AND MICA

A composite insulation consisting of rope paper faced on one side with two layers of India mica films and tissue paper.

This material has a wide range of utility in the field of moderate voltages and temperatures.

It is furnished in sheets 36 x 36 inches in the following stock thicknesses:—

List No.	Thickness of Raw Paper, Inches	Approximate Finished Thickness, Inches	Layers of Mica	Approximate Oz. per Sheet	List Price per Lb.
1327	.003	.007	2	7½	\$2.24
1328	.005	.010	2	12	1.67
1329	.010	.015	2	15	1.33

NO. 27 PRESSBOARD AND MICA

This material is composed of No. 1 pressboard faced on one side with two overlapping layers of India mica films and tissue paper.

Mechanically the sheet possesses greater rigidity than No. 26 rope paper and mica, otherwise, the insulation is of the same order.

It is furnished in sheets 36 x 36 inches and the following thicknesses are kept in stock:

List No.	Thickness of Raw Pressboard, Inches	Approximate Finished Thickness, Inches	Layers of Mica	Approximate Oz. per Sheet	List Price per Lb.

NO. 29 FISH PAPER AND MICA

This material consists of fish paper faced on one side with two overlapping layers of India mica films and tissue paper. The fish paper employed is also known as Fyberoid, Tarpon Paper, Peerless Paper, etc.

This insulation is recommended when a material stronger than rope paper or pressboard is desired as a base for the mica films.

It is furnished in sheets 36 x 47 inches, and the following thicknesses are kept in stock:

List No.	Thickness of Raw Fish Paper, Inches	Approximate Finished Thickness, Inches	Layers of Mica	Approximate Lbs. per Sheet	List Price per Lb.

INSULATING MATERIAL

ROUND MICANITE WASHERS

Micanite Washers are suitable for insulation where excessive heat is not encountered. For grid rheostat and other insulation work where high temperature is to be expected we advocate built-up mica washers.

We manufacture round washers of any size not listed below, and also oval, square or rectangular washers with either round or square holes, etc., etc. Prices on application.

When ordering Round Micanite Washers kindly specify inside diameter desired, as this price list covers round washers of the specified outside diameters irrespective of the inside diameters.

Micanite Washer List Price per 1000

Above list price applies only on orders of 500 and over of a size.

Orders less than 500 of a size but over 200 add 10 per cent. to above list.

Orders less than 200 of a size add 20 per cent. to above list.

INSULATING MATERIAL
BUILT UP MICA WASHERS

These washers are built up with the aid of cement from solid sheet mica stampings to an exact thickness and are recommended for insulation where high degree of heat is encountered, such as in grid rheostats, arc lamps, etc.

Orders less than 500 of a size but over 200 add 10 per cent. to above list.

Orders less than 200 add 20 per cent. to above list.

INSULATING MATERIAL

MICANITE TUBING

We furnish square, oval, hexagonal and other special shaped tubing of any size for special insulating requirements; large round tubing for induction coils, specially treated tubes or bushings for apparatus immersed in oil, special heat-proof bushings rolled without cement for spark plugs, gas engines, etc. Net prices quoted on receipt of specification.

Round Micanite Tubing is manufactured in various grades as follows:

ENTIRE MICANITE TUBING

This tubing is made entirely of Micanite with no paper whatsoever in its construction. It is recommended for high potential work; for apparatus subjected to sufficient heat to render paper objectionable. For sleeves for small commutators; brush holder studs, grid rheostat rods, etc.

A thin covering of paper is applied, when requested, on the outside of the tube to guard against the scaling of the mica when mica washers or metal parts are to be assembled on the tubes. Such covering is less than 2 per cent. of the material.

MICANITE AND RICE PAPER TUBING

This tubing is composed of 85 per cent. Micanite and 15 per cent. paper and is used universally where high-grade insulation is required. The small amount of paper does not materially affect the insulating qualities of the tube. It effects a saving in the cost of manufacture, enabling us to offer this grade at a lower price than the entire Micanite Tubing.

ROUND MICANITE TUBING

List price per foot in lengths of one foot and over.
Lengths under one foot special prices.

For orders less than 24 feet add 20 per cent. to list.

MICANITE AND ASBESTOS TUBING

This tubing is composed of 60 per cent. Micanite and 40 per cent. of asbestos. It is intended for apparatus subjected to moderate heating where a lower priced tube than the Entire Micanite Tubing will answer the requirements. It is used on grid rheostats, resistance boxes, etc.

MICANITE AND ROPE PAPER TUBING

This tubing is composed of 60 per cent. Micanite and 40 per cent. paper. It is recommended for apparatus which is not subjected to enough heat to affect the paper and where the insulating requirements are fully met by a composite material of this kind. This grade has been adopted by many street railway companies for grid rheostat rods.

NO. 6 AND 7 MICANITE PLATES For Electric Heating Appliances

We furnish Micanite Plates to meet the unusual requirements for insulation in electrical heating appliances, using a special cement adapted to withstand a high degree of heat.

No. 6 India Micanite Plate is recommended for devices in which the heating elements attain the ordinary temperatures required for cooking utensils, small disc heaters, domestic flat irons, etc.

No. 7 Amber Micanite Plate will stand a higher degree of heat than No. 6 and should be used in devices where the elements are subjected to higher temperatures than the ordinary.

Prices, etc., on application.

NO. 30 MICANITE PAPER TAPE

This tape consists of a tissue paper faced on one side with one overlapping layer of carefully selected India mica films.

It is extensively used for insulating armature coils and bars in conjunction with Linotape or the ordinary friction tape.

In thickness it runs from .003 to .005 and is put up in rolls containing 100 lineal feet.

The following widths are kept in stock:

List No.	Width, Inches	Approx. Thickness, Inches	Approx. Oz. per Roll	List Price per Lb.
1355	$\frac{3}{4}$ ins.	.003 to .005	3	\$3.13
1356	1	.003 to .005	4	3.13

Other widths made to order.

NO. 32 MICANITE PAPER TAPE

This paper is of the same order as No. 30 Micanite Paper Tape, except that the mica layer is faced on both sides with tissue paper, adding slightly to its thickness and mechanical strength.

In thickness it runs from .005 to .007.

The following widths are kept in stock:

List No.	Width, Inches	Approx. Thickness, Inches	Approx. Oz. per Roll	List Price per Lb.
1357	$\frac{3}{4}$.005 to .007	4 $\frac{1}{2}$	\$3.13
1358	1	.005 to .007	6	3.13

Other widths made to order.

MISCELLANEOUS APPLICATIONS OF MICANITE

Transformer Insulation

As most transformers of modern construction are immersed in oil, the Micanite used in this line of apparatus is treated to withstand the effect of oil. We have made a specialty of Micanite for this purpose. Unless specially treated, the oil will attack the cement and open up the plate.

Armature Troughs, Molded to Shape

The manufacturer is equipped to mold troughs of various shapes either from entire Micanite, rope paper and mica, fish-paper and mica, or fullerboard and mica. For apparatus of the Siemen & Halske and similar types where the armature winding also serves as commutator bars, they are equipped to bake the troughs so as to furnish them of the same quality as standard commutator plate.

Static Discs

To get best results for static machines, a special grade of mica must be used. Experience has shown that all kinds of white mica are not suitable for this purpose. The manufacturer is very careful in selecting the proper quality and in finishing the discs we take all the necessary precautions to make them run true and well balanced.

Special Micanite Plate for Condensers and Ozonators

For this purpose, they produce a plate from selected India mica containing the proper proportion of cement and treated to withstand as much as possible the moisture in the atmosphere which such apparatus appears very readily to attract.

Empire Oiled Cloths

The fabric base of Empire oiled cloth is a specially finished and closely woven cambric made from long fiber cotton; special attention being paid to its tensile strength. The coating consists of two or more films of pure oxidized oil, which is prepared under the manufacturer's own special process.

The number of each grade, as will be noticed, gives an indication of the thickness.
For Empire cloth cut into tape see under Linotape.

Empire Oiled Canvas and Ducks

Nos. 155 and 16 are made on fabric bases that have been specially finished to insure smooth and even coating of the oil. Nos. 200 and 300 ducks have great resistance to mechanical wear and imperviousness to moisture, but do not have the same smooth surface as the other cloths.

155	Canvas	.015	0.381	.007	600	740	\$0.61
16	Canvas	.016	0.406	.005	765	730	.65

300	Duck	.030	0.76292

Empire Oiled Linen

For purposes of insulation linen has no special advantage over cotton except that of resisting a slightly higher voltage for a given thickness.

We furnish only one grade, the base being an imported Irish linen coated with double films of special oxidized Empire oil, and the fabric is thoroughly impregnated.

6	Linen	.006	0.152	.002	1258	1373	\$1.07
---	-------	------	-------	------	------	------	--------

Empire Oiled Silk

Empire oiled silk has for a base a closely woven fabric of pure silk. It is an excellent insulation where a material possessing very high insulating qualities combined with extreme thinness and great flexibility is demanded. Two grades are manufactured in two thicknesses.

44	Silk	.004	0.102	.00175	1230	1330	\$0.91
440	Silk	.004	0.102	.00175	1350	1450	1.2
66	Silk	.006	0.152	.00375	1100	1200	1.0
660	Silk	.006	0.152	.00375	1230	1330	1.2

All the above Empire cloths, etc., are furnished in rolls containing 25, 50, 100 yards or in any length desired.

We cut any width of any of the above material to order provided order amounts to multiples of 72 square yards.

For list of standard oiled tapes see under Linotape.

INSULATING MATERIAL

Linotape

Linotape is the registered trade-mark name under which we sell Empire Oiled Cloth in tape form.

We cut tape in any width from $\frac{3}{8}$ inch and above, from all the grades of Empire material.

Linotape is an insulating tape of the highest order. Its virtue, as with the Empire material, rests in the multiplication of oxidized oil films on its surfaces. It has come into general use as the insulating medium for cables of all descriptions, and is used extensively in coil winding, cable splicing, bus bars, and all high tension work.

It is furnished in rolls guaranteed to contain 72 lineal yards, each roll coated on the edges with paraffin to exclude moisture and both straight and bias are continuous in the roll.

Prices of widths greater than $1\frac{1}{2}$ inches are proportionate to price of 1 inch width. All above Linotape of $\frac{3}{8}$, 1 and $1\frac{1}{2}$ inch widths are carried in stock. Other widths furnished promptly on order.

In addition to tapes listed above we will cut any width of any thickness of Empire cloth to order provided order amounts to multiple of 72 square yards.

Empire Oiled Paper

The line of Empire Oiled Papers is very complete, especially so in regard to its wide range of thicknesses. The papers forming the bases all possess the greatest tensile strength consistent with their thickness and have been selected for their uniformity of thickness, and freedom from deleterious chemicals such as sulphite, etc. The oil films with which they are coated are of exactly the same nature as the films on the Empire cloths, linen, etc.

We draw special attention to the condenser papers which, on account of their extreme thinness and high tensile strength, are giving great satisfaction to the manufacturers of induction coils, and other delicate work. The thicker papers have been selected for their great tensile strength, density and evenness of texture.

Furnished in rolls 36 inches wide, containing 25 or 50 yards, or in sheets 36 x 36.

INSULATING MATERIAL

Kablak Cloth

Black

The insulating films on Kablak cloths are asphaltic. The asphalt used is one selected on account of its superior insulating and thermal qualities. The reducer, or solvent of the asphalt, is the Empire cloth solution; in this way are obtained in one article the valuable characteristics of both the Empire oxidized oil and the asphaltum. The fabric bases of Kablak cloths are of the same quality as those used for Empire oiled cloths. All the cloths have two or more films on their surfaces.

Kablak cloths are unequalled for maintaining their insulating qualities and their flexibility under prolonged high temperatures, and under prolonged electric stresses. These qualities make Kablak cloth especially adaptable for the insulation of cables, and its use in this direction is rapidly expanding.

The following grades are kept in stock.

Furnished in rolls containing 25, 50 and 100 yards, or any length desired.

Any tape width of any above Kablak cloth will be cut to order provided order amounts to 72 square yards or multiples of same.

The standard rolls of tape contain 72 yards in continuous length. Rolls containing a greater number of yards are furnished on demand if size of order justifies.

Kablak Papers

Black

The insulating films on Kablak papers are identically the same as on Kablak cloths. The base papers are similar to those used for Empire oiled papers.

The applications of Kablak papers in the electrical field run on parallel lines with Empire oiled papers; some engineers preferring an insulating film composed of a mixture of asphalt and oxidized oil, to a film composed entirely of oil.

Furnished in rolls containing 25, 50 and 100 yards, or in sheets 36 x 36.

The following grades are kept in stock:

List No.	Grade of Base Paper	Thickness		Thickness of Film Inch	Approx. Dielectric Strength		List Price per Yard
		Inch	M/m.		per .001 Inch	per .001 Inch	
1105	Rope	.005	0.13	.002	1600		\$0.21
1107	Rope	.007	0.18	.002	900		.27
1109	Rope	.009	0.228	.004	1200		.29
1112	Rope	.012	0.305	.003	800		.41
1115	Rope	.015	0.381	.006	900		.44

Any tape width of any of above Kablak Paper will be cut to order provided order amounts to multiple of 144 square yards.

Insulating Materials

Efforts to secure the best materials for use in the manufacture of Micanite, Empire and Kablak materials, the manufacturers, during the past twenty years, constantly conducted research work, analyses and tests on not only raw materials, but on various kinds of insulators. Their testing laboratories are fully equipped with apparatus for conducting the necessary electrical, mechanical and chemical tests, and their testing engineer has had long experience in this work. The engineering staff has had an experience in the manufacture and application of insulation extending over a period of nearly a quarter of a century.

Many of the insulators listed in this bulletin have been selected by them for use in the manufacture of the Empire and Micanite products, and we believe from the extended tests, that they are the best of their various kinds.

UNTREATED PAPERS, ETC.

List No.	Material	Thickness	Width of Roll	Approx. Lbs. of Roll	Approx. Size of Sheets	Approx. Pounds per 100 Sq. Yds.	Pounds per Sheet	List Price per Pound
2615	Japanese	.001	36 ins.	8		2.66		\$1.36

Mico Japanese Paper is a soft, fibrous paper and has a great deal of strength taking into consideration its extreme thinness.

Mico Condenser Paper, as its name implies, is used extensively for condensers. It is the strongest and toughest of all the thinner papers.

Mico 12½ ounce duck is an exceptionally strong, heavy duck, useful for armature work, etc.				
2738	12½ oz. duck.....	.030	36	120
Prices on untreated cloths quoted on application.				

Mico Cement

Mico Cement is a special cement of high insulating value, water repellent, waterproof and flexible. This is a most satisfactory cement for sticking together oily, glossy surfaces such as that possessed by Linotape, Empire cloths and papers.

For pasting labels onto oily or damp surfaces it has no equal.

The "setting up" of Mico Cement is hastened by the application of heat, but its adhesive qualities are equally as good without it.

Mico Cement has such excellent and unusual qualities that if trouble is being experienced with any other cement of whatever nature, we would advise giving Mico Cement a trial. New fields are continually being found for its use.

Mico Cement requires a special solvent, which we also supply when it is necessary to reduce the consistency of the cement.

Western Electric

FANS

Railroad Coach Wall
Fan with Switch

Railroad Coach Wall
Fan without Switch

Resistor and
Choke Coil

Railroad Car Ventilating Outfits

The Western Electric Railway Exhaust Fans are especially adapted for use in the kitchens of dining cars, and in buffet cars, for removing smoke, dust, and the odors of the cooked food. They should be installed in the sides of the car. Intake and exhaust pipes should be avoided; if such pipes are necessary, they should be short and straight.

These fans are the well-known Western Electric standard 12 inch exhaust fans. They are finished in dull black with polished brass blades. A speed regulator to give two additional speeds can be furnished when desired.

DIRECT CURRENT

List No.	Size, Ins.	Speeds	R. P. M.	Watts at High Speed	Voltages	List Price
W-196853B	12	1075	25	24-30	\$26.20

Railroad Car Fans

The Western Electric Railroad Car Fans are designed especially for service in parlor and coach cars where electric current of 24, 30 or 60 volts is obtainable. The use of electrical storage batteries and small turbine generators to furnish current for electric lighting has made it possible for the railroads to equip their cars with fans, thus insuring for the passenger a perfectly ventilated conveyance, free from the annoyance caused by the dust and soot with the present methods of ventilation.

These fans are similar to the standard fans, but are especially designed for this particular service. The fan base, motor body and guard arms are finished dull black. The guard is dipped and lacquered brass. The blades are polished and lacquered brass. Special finishes can be supplied at a slight increase in cost, to match the hardware of the car for which they are intended.

Direct Current Electric Railway Fans

These fans are used on electric railway cars, including subway, surface, elevated and interurban, where 500 to 600 volts is the prevailing voltage. They are the standard railroad coach fans, without switch, wound for 220 volts and supplied with a special resistor to take up the extra voltage. They have one lead grounded to prevent shock to any person coming in contact with the fan. The resistor also contains a choke coil to reduce the rush of current when the fan is first connected to the line.

The operation of two fans in series is not recommended, owing to the danger of burning out both fans should one fail to operate. Finish: The same as Railroad Car Fans listed above.

W-240312	12	1600	90	500 to 600	\$27.88
----------	----	-------	------	----	------------	---------

Above fans furnished for 220 volts, add to list \$2.36.

ELECTRIC CAR HEATERS

Showing Ventilated Porcelain Core

Showing Heating Element Assembled

Round Type Enclosing Case

Panel Heater Front Type 329-E

DESCRIPTION

A satisfactory street car heating system can only be obtained by an equal distribution of heat throughout the car and the best method of accomplishing this is to distribute the heaters over as large an area as possible.

This can be done very efficiently by the use of the line of electric car heaters which we list herewith. Years of experience have emphasized the fact that to make a durable, reliable and efficient heater the coil must be supported substantially on a support that is properly ventilated. All the heaters shown are equipped with a quick detachable ventilated core. Any of the coils or heating elements can be removed intact, without disturbing the other coils in the heater, by simply removing the two special nuts.

By the use of these core supports the following advantages are derived:

Long life to resistance wire. The wire wound on the ventilated core is kept at a very much lower temperature on account of the free passage of air through the coils, consequently the wire does not overheat.

Saving of current. The wire remaining at a lower temperature and the resistance receiving the usual amount of current, it must necessarily throw off the heat more rapidly than from a solid core, which naturally finds its way into the car, therefore more heat is radiated with less current.

Fewer renewals of wire. The wire not being overheated there is consequent longer life.

Interchangeability. The cores or heating elements are made identical to each other, and by the simple method of detaching two special nuts, one at either end of the heater, a heating element may be replaced without removing heater.

Summing up the above features, they resolve themselves into two words:

Money saver. Both in labor and material.

These cores are constructed so as to interchange with the solid porcelain cores now on the market, and a heater with solid porcelain cores can be converted into a ventilated porcelain core heater at very little expense, making it a more efficient and durable heater.

ELECTRIC CAR HEATERS

No. 120E. Length 21½ Inches. Diameter 3¼ Inches

Cross Seat Cylinder Heater

One Coil No. 120E

For use in cross seat cars or in cars having longitudinal seats supported on legs.

Arranged for one degree of heat. When two or three-degree graduations are desired, heaters are wired in separate circuits. Leads can be brought out of one end or both ends, as desired. Finish, black japan, oven baked.

List No.	Description	List Price
820699	Single cross seat cylinder heater.....each	\$6.80

820720	Set of 24 heaters, exclusive of front.....per set	242.56

Above prices (per set) include necessary lead wire, one (1) three-degree knife switch enclosed in sheet metal switch box, mounted on slate base, fuses to suit requirements. Prices on fronts to suit particular requirements will be quoted on application.

No. 406E. Length 27 Inches. Width Inside 6½ Inches. Width Over Flange 8½ Inches

Panel Heater

Two Coil No. 406E

For use in cars having longitudinal seats, arranged for three degrees of heat.

Size of front 29 x 8¼ inches.

Finish black japan, oven baked.

This construction is a deviation from the general practice, giving a junction box self-contained in the heater casing, as will be noticed on left hand end of heater.

Each heating element is self-contained and both are held in place by one nut on either end of heater.

Leads can be brought out of one end of the heater, the return being brought through the center supporting rod, or leads may be brought out of both ends.

Made in different lengths to suit requirements.

Heater fitted with spring clip terminals when desired.

820735	Set of 8 heaters.....per set	93.88	820741	Set of 20 heaters.....per set	211.20
820736	Set of 10 heaters.....per set	113.60	820742	Set of 24 heaters.....per set	250.24
820737	Set of 12 heaters.....per set	133.12			

This heater differs from the older type of Cross Seat Heater in that the heater flanges themselves rest on the seat rails, thus doing away with extra hangers. The deflector, or cover of heater, rests on and is attached to the heater case by four nuts, as shown, and acts as a heat deflector, which prevents the pocketing of heat under the seat cushion.

Each element is self-contained and can be removed intact by detaching two nuts, without removing the heater case from the seat. The case is elongated, giving a space for the lead connections. The leads are brought out of one end of each element, the current being brought back through the supporting rod. This arrangement eliminates the possibility of broken wires by chafing of the porcelain sections when insulation is made by wire through the porcelain.

No. 144E

**No. 144-EA
Switch with Sheet Metal Case**

Vestibule Heater

FOUR COIL No. 144E

Size 24 inches long; 14½ inches wide; 4¼ inches deep.

This heater is designed for use in vestibule of cars or for small rooms, and can be wired for one or three degrees.

List No.	Description	List Price
820743	Single vestibule heater.....	Each \$20.84

Car Heater Switch

No. 114EA

This outfit consists of two single pole quick break knife switches so arranged that with one switch closed, current is supplied for one degree of heat; with the other switch closed two degrees of heat are given and with both closed, three degrees of heat are provided which are mounted on the slate switch base and the entire outfit is enclosed in a sheet metal case with hinged door. In order to close the door while one or both switches are open, it is necessary to throw the open switch completely over so that the hands rest in the recess provided in the box.

6	Ballast or Track	15	18½	31	96	18.20

NOS. 117 AND 118 TRACK OR BALLAST JACKS

Single acting, operating on the down stroke of the lever, or tripping at any position.

List No.	Style	Capacity Tons	Lift Inches	Height Inches	Weight With Pole Lbs.	List Price Each
117	Track or Ballast	10	12½	20½	55	\$13.20
118	Track or Ballast	15	18¾	28	70	18.20

Car and Industrial Jacks
NOS. 50, 51, 2, 4, 19

Single acting, operating on the down stroke of the lever.

All working parts are drop forged steel with massive malleable standards. Bearings are heavy trunnions.

These jacks are used extensively by steam and electric railroads, by contractors, bridge builders and many classes of industries. They are powerful, rapid, highly efficient and built for rough, abusive service.

List No.	Style	Capacity Tons	Lift Inches	Height Inches	Weight Lbs.	List Price Each
50	Industrial	5	8½	15½	32 with bar	\$12.00
51	Industrial	5	13½	20	40 with bar	13.20

19	{ Car, Industrial and Bridge	15	17½	28	94 with pole	21.00

Geared Jacks
NOS. 25 AND 35

Single acting, operating on the down stroke of the lever.

These jacks are especially designed for handling railroad cars, loaded or empty, Pullman or day coaches, locomotives and heavy industrial work—all working parts are drop forged steel, or cast steel; heavy malleable standard, trunnion bearings.

List No.	Capacity Tons	Lift Inches	Height Inches	Weight Lbs.	List Price Each
25	25	16½	27	150 with pole	\$80.00
35	35	16½	26½	200 with pole	108.00

Delivery F. O. B. Factory, Chicago, Ill. For warehouse deliveries write nearest house.

No. 25

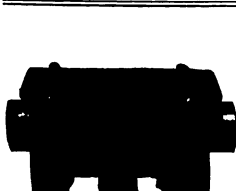

TYPES PJCA AND PJX

Furnished Complete with Cast Cover, Cover Gasket and Fastening Screws for Cover

Type PJX Condulet is arranged with two main hubs and two branch hubs, tapped for conduit of various sizes, as noted in the schedule.

The hubs on these Condulets are so located as to insure a clearance of at least an inch between the surface wired over and the conduit. When these Condulets are used on car roofs, this feature of construction prevents the accumulation of cinders and consequent deterioration of car covering along the line of conduit.

The cover overhangs the Condulet body and is held in place by four heavy brass screws. The joint is made water-tight by a gasket.

Important Information Concerning Condulets Listed on This Page

Finishes: Black enamel is the standard finish for Condulets, and will be furnished unless another finish is specified on the order. Galvanized finish on exterior and black enamel finish on interior of Condulets will be furnished, at same price as all black enamel finish, when the order specifies galvanized finish.

Black enameled and galvanized Condulets of the same type and size may be assorted to make up a standard package.

Gasket is listed separately on page 177. Condulet reducers are listed on page 171.
Screws for above Condulets are specified on page 180 and listed on page 181.

CONDULETS—DB SERIES
TYPES DB, DBB AND DBC
 For Postal Car Ceiling Light Installations
 Furnished Complete as Shown in Illustrations

Body and Canopy of Type DBC
(Broken-away View)

These Condulets are especially designed postal car lighting fixtures and possess all the features essential to such fixtures, as follows:

Strength, rigidity, easy and quick removal of reflectors, ample wiring room, free access to electrical connections, and as pleasing an appearance as is consistent with the conditions imposed.

They comprise a body, canopy, stem, lamp receptacle, reflector holder and reflector.

The body is provided with threaded hubs for conduit and is fastened to car ceiling by four screws.

The canopy screws into the body and is clamped to the stem, forming a rigid construction which cannot become loosened by vibration.

The reflector holder is extremely simple and rugged. The reflector is released by one half turn of the clamping ring.

Ample wiring room is provided in the body, and the removable canopy allows ready access to the connections without disturbing any other part of the Condulet.

Plans showing the proper location of these Condulets in postal cars, to meet Post Office Department specifications, will be furnished upon request.

In ordering, the following data must be furnished:

First: Location of Condulet in car; i. e., letter case, bag-rack or storage. Second: Wattage of lamp. Third: Style of lamp bulb. Fourth: Distance from floor to ceiling at point where Condulet is to be installed. Fifth: Finish of reflector—porcelain enamel or aluminumized. Sixth: Curvature of car ceiling, which can best be given by a cross section drawing of the car.

Finishes: Black enamel is the standard finish for Condulets, and will be furnished unless another finish is specified on the order. Gray lead finish on exterior and black enamel finish on interior of Condulets will be furnished, at same price as all black enamel finish, when the order specifies gray lead finish. Galvanized finish on exterior and black enamel finish on interior of Condulets will be furnished, at same price as all black enamel finish, when the order specifies galvanized finish. For special plated finishes, see page 182. For cast brass and cast bronze Condulets, plain and with special finishes, see page 182.

Black enameled, gray lead and galvanized Condulets of the same type and size may be assorted to make up a standard package. No other assortment is allowed.

Condulet reducers are listed on page 171.
 We will furnish incandescent lamps.

CONDULET BODIES TYPES JRR AND KRR

For Side Bracket Fixtures

Take Crouse-Hinds Types JRRH or JRRV Side Bracket Hoods; Crouse-Hinds Terminal Block CF101, and Safety Car Heating and Lighting Co. Fixtures Nos. 8211 or 8825

These Condulet bodies are designed for mounting back of car finish; and fittings or fixtures may be screwed directly to them, instead of to the finish of the car; therefore, it is unnecessary to reinforce the car finish where the fastening screws enter.

The use of Crouse-Hinds terminal block CF101 eliminates the necessity of soldering joints. This facilitates the removal of the fixture for refinishing.

	TYPE JRR CONDULET BODIES—Black Enamel Finish			
	Size in inches	1/2	3/4	1
	Catalogue Number	JRR11	JRR22	JRR33

	Shipping Weight Std. Pkg	185 lbs.	145 lbs.	100 lbs.
	List Price, each	\$1.90	\$2.10	\$2.30

Screw holes for fastening side bracket hoods to Condulet bodies are drilled and tapped for 10-30 screws.

For finishes and assortments, see note on page 154.

Types JRRH and JRRV side bracket hoods are listed on page 155a. Gasket for use between types JRRH or JRRV side bracket hoods and above Condulet bodies is listed on page 177. Condulet reducers are listed on page 171.

Terminal block CF101 is listed on page 180.

We will furnish fittings or fixtures of other manufacturers for above Condulet bodies.

**CONDULETS—FB SERIES—HOUSINGS FOR BATTERY FUSES
TYPES FBL AND FBR**

Furnished Complete with Fuse Block for 250 Volt Fuse, but without Fuse

Type FBL with Fuse Block CFB200E, Showing
Enclosed Fuse Installed

Type FBL Conduit

Type FBR Conduit

These Condulets are of substantial design and suited to meet the most severe service. They are provided with a close fitting hinged cover which protects the contents of the Condulet from dust, cinders, and the weather.

The wire terminal connections are of the soldered sleeve type and, therefore, can be disconnected without unsoldering. This type of wire terminal construction permits the easy disconnection of the battery lead and eliminates the use of a hand connector within the battery box.

CONDULET BODY TYPE MOC

For Deck Sill Installations

Takes Crouse-Hinds Types MOH or MOV Side Bracket Hoods; also Takes Crouse-Hinds Terminal Block CF101

These Condulet bodies are designed for mounting back of deck sill molding, and side bracket hoods may be screwed directly to them, instead of to the molding of the car; therefore, it is unnecessary to reinforce the molding where the fastening screws enter.

The use of Crouse-Hinds terminal block CF101 eliminates the necessity of soldering joints. This facilitates the removal of the side bracket hoods.

Important Information Concerning Condulet Bodies Listed on This Page

Fixture fastening screw holes are drilled and tapped for 10-30 screws.

We will furnish fittings or fixtures of other manufacturers, but the above Condulet bodies take the following:

SAFETY CAR HEATING AND LIGHTING CO.—Nos. 1982, 2328, 2329, 2330, 2331, 2332, 2491, 2495, 2497, 2498, 2816.

Finishes: Black enamel is the standard finish for Condulet bodies, and will be furnished unless another finish is specified on the order. Gray lead finish on exterior and black enamel finish on interior of Condulet bodies will be furnished, at same price as all black enamel finish, when the order specifies gray lead finish. Galvanized finish on exterior and black enamel finish on interior of Condulet bodies will be furnished, at same price as all black enamel finish, when the order specifies galvanized finish. For special plated finishes, see page 182. For cast brass and cast bronze Condulet bodies, plain and with special finishes, see page 182. For aluminum Condulet bodies, plain and with black enamel finish, see page 182. Black enameled, gray lead and galvanized Condulet bodies of the same type and size may be assorted to make up a standard package. No other assortment is allowed.

Terminal block CF101 is listed on page 160. Condulet reducers are listed on page 171.

**CONDULET BODIES WITH OBROUND OPENINGS
TYPES LBA AND LBV**

Take Obround Covers and Obround Conduletto Fittings

In type LBA Condulet the hub through the flange is at an angle of 18 degrees from the perpendicular, to compensate for the curvature of the car roof, thus allowing the conduit to enter the car parallel with the side finish. It is exceptionally suited for use where it is desired to bring conduit from the car roof to side brackets or berth lights.

Type LBV Condulet is for use where the conduit makes a right angle turn and passes through the roof or floor of a car.

The flange completely covers the opening made for the conduit, and, by the use of a gasket, this opening is made water-tight.

Gaskets for Obround covers are listed separately on page 176.

TYPES TJ AND TJD CONDULETS

FOR USE WITH PORTABLE TELEPHONE EQUIPMENTS

Take the Following Jacks: Western Electric Co., No. 99 or 152. Stromberg-Carlson, No. 119

Type TJ Condulet is Furnished Complete with Insulating Bushing and Metal Cover with Jack Support and Gasket Attached

Type TJD Condulet is Furnished Complete with Two-Wire Hole Porcelain Cover and Metal Cover with Jack Support and Gasket Attached

These Condulets are designed for housing telephone jacks. The support for the jack is mounted on a gasketed metal cover, from which it is properly insulated. When the plug is removed, a lid automatically closes the opening and prevents the entrance of dust, moisture or insects.

Type TJ Condulet is intended for use under the body of a railway car. It has a swivel base which allows the plug to pull out easily when the car is moved. An insulating bushing is provided, through which the wires pass to the interior of the car.

Type TJD Condulet is intended for mounting on poles or buildings along the right-of-way of a railroad, transmission line, canal, etc. The line wires enter the Condulet through a 1/2-inch Obround 2-wire hole porcelain cover.

Type QD plug receptacle attachment, listed at the right, is an auxiliary weather-proof housing, which can be attached, as shown in above illustration, to any Conduit having a flat surface to which the housing can be fastened, provided there is sufficient wiring space in the interior. The surface to which type QD attachment is to be fastened must be properly drilled and tapped for mounting. If specifically ordered this drilling and tapping will be done at the factory, without extra charge. The receptacle is of Hubbell type and will take standard 10-ampere Hubbell plug caps. In railroad use, the attachment is used chiefly to provide connections for vacuum cleaners and portable hand lamps.

*Type UGEN Conduit is regularly furnished with rectangular receptacle BR100, requiring the use of rectangular plug BPF100 or BPB100, but if specifically ordered, round receptacle BRA100, requiring the use of round plug BPFA100 or any M. C. B. standard plug, will be furnished, at an advance of \$2.75 in the list price. A spring door is regularly furnished with above Conduit, but if specifically ordered, removable door will be furnished, at the same price.

The wire terminals of receptacle BR100 are drilled $\frac{1}{4}$ of an inch in diameter and will take any size cable up to and including No. 1 B. & S. gauge.

If specified on the order, 200-ampere rectangular receptacle BR200 will be furnished with type UGEN Conduit, at an advance of \$1.25 in above list prices. When so arranged, the Conduit is suitable for low voltage electric welding machines of 200-ampere capacity.

The wire terminals of receptacle BR200 are drilled $\frac{1}{4}$ of an inch in diameter and will take any size cable up to and including 00 B. & S. gauge.

Finishes: Black enamel is the standard finish for Condulets, and will be furnished unless another finish is specified on the order. Galvanized finish on exterior and black enamel finish on interior of Condulets will be furnished, at same price as all black enamel finish, when the order specifies galvanized finish.

Black enameled and galvanized Condulets of the same type and size may be assorted to make up a standard package. No other assortment is allowed.

Receptacles and plugs for type UGEN Condulets are listed on page 166.
Plugs for type UGEN Condulets are listed on page 163a.

**CONDULET BODIES
TYPES UGC AND UGX**

Inside Dimensions: 6 $\frac{1}{8}$ x6 $\frac{1}{8}$ x3 Inches

Type UGC Condulet Body with Blank Cover CX00 Attached

Types UGC and UGX Condulets, being extra heavy, are particularly suited for use in railroad yards, manholes, subways, around coast defense fortifications and wherever a rugged water-tight Condulet is desired.

They can be used in combination with the yard charging Condulets, illustrated and listed on pages 163 and 164, either for surface or underground conduit installations.

The cover is firmly held in place by brass cap screws, and a heavy gasket of high grade rubber securely seals the opening. The use of brass cap screws and a high grade rubber gasket makes it easy to take off and replace the cover.

Type BRH is furnished Complete with 100 Ampere Round Receptacle, BRA100. See note below†
Type BRHA is furnished Complete with 100 Ampere Round Receptacle, BRA100. See note below†

These Condulets are designed for storage battery charging, and are particularly intended for railroad cars and electric vehicles.

Two styles are made, one having swivel pedestal support and the other the M. C. B. standard bracket.

The receptacles furnished with these Condulets are of two types—rectangular and round. These receptacles are interchangeable in the different housings. The rectangular receptacle and plug are designed for extra heavy duty. The round receptacle and plug are so designed as to overcome the defects which have heretofore existed in receptacles and plugs of this design.

The designs of the plugs are such as to prevent a short circuit or reversal of polarity.

Finishes: Black enamel is the standard finish for Condulets and plug handles, and will be furnished unless another finish is specified on the order. Galvanized finish on exterior and black enamel finish on interior of Condulets and plug handles will be furnished, at same price as all black enamel finish, when the order specifies galvanized finish.

Black enameled and galvanized Condulets or plugs of the same type may be assorted to make up a standard package.

TYPE YQ CONDULETS

For 2 or 3-Pole Plug Receptacles and 2 or 3-Wire Cartridge or Plug Fuse Cut-outs

**Furnished Complete with Crouse-Hinds Plug Receptacle and Crouse-Hinds Cut-out,
but without Plug or Fuses**

Type YQ

(Broken-away View)
Showing Cut-out PE52E and Receptacle RYQ302 Mounted, also
Plug RQ303 and Padlock
Plug and Padlock are not included in List Prices for Condulets

These Condulets provide a housing for a combination of plug receptacle and cut-out.

They are particularly suited for use in shops having portable tools, also in garages, laundries, railroad yards, etc. They are weather-proof and, therefore, can be installed either indoors or outdoors.

Two types of N. E. C. cut-outs are furnished—cartridge and plug. The cartridge type can be used on circuits up to 30 amperes, 250 volts, and the plug type on circuits up to 30 amperes, 125 volts.

The door over the cut-out is provided with a spring catch and can be locked with a padlock if desired. The door covering the plug opening is rabbetted and is kept closed by a plunger spring, when the plug is not in place, thus preventing the entrance of dust, moisture and insects.

CONDULETS
TYPE MD

Generator or Motor Disconnecter for Car Service

Type MD

Type MD Condulet provides an easily operated mechanical means for connecting and disconnecting wires leading from the generator to the regulator or from the controller to the motor. The receptacle part fastens to the car body, while the cables from the generator or motor are attached to the plug. The plug is pulled into the receptacle by a lever, and contact can be broken only by operating this lever, which is provided with a device to lock it in closed position.

All current carrying parts are thoroughly insulated and the whole device is constructed to withstand the severe usage of railroad work.

One of the principal advantages of type MD Condulet is that it prevents incorrect connections being made when the trucks are replaced after having been removed from the car for repairs. Another feature is that the electrical connections can be instantly disconnected without the use of tools or the removing of any parts which might become lost. The connections can be made or broken by car men, without the services of an electrician.

"SQUARE D" STEEL ENCLOSED SWITCHES

Fig. 3. No. 5342, 3 Pole, 60 Amp., 500 Volts, A.C. Showing Detachable End Plates, The Quick-break Mechanism in These Switches Insures All Blades Opening at the Same Time.

Description

"Square D" Steel Enclosed Switches are designed for use in connection with installations whenever it is desirable to completely enclose all terminal wires and live parts for the advancement of "Safety First" principles, standardisation of equipment, the prevention of tampering with circuits and the elimination of accident hazards.

SAFETY

The switch and cutout unit are completely enclosed in a sheet steel box provided with a hinged cover which is held closed with a simple spring catch. The switch is operated by a crank handle located outside the box. The switch may be locked in the "off" position to prevent accidents while repairs are made on apparatus controlled by the switch, or may be locked in the "on" position permanently, if it is desired that the apparatus be not used.

Means are also provided to seal the cover shut to prevent unauthorized persons over-using the switch or tampering with live connections.

All "Square D" Steel Enclosed Fused Switches of over 30 ampere capacity for circuits of more than 250 volts are of the quick break type, and are designed for the use of enclosed fuses—Edison Plug type for 125 volt switches and National Electrical Code Standard Cartridge Fuses for 250 volts A.C. or D.C., 500 volts A.C. and 600 volts A.C. or D.C. Spacings for live metal parts are as given in the National Electrical Code.

CONVENIENCE

Removable and interchangeable end plates are provided.

These plates are furnished blank, with knockouts, or with porcelain outlet covers, according to installation requirements. Convenient knockouts are furnished in sides of boxes.

All boxes are designed so that ample wiring space is provided inside to make the necessary connections.

"Square D" Cabinets are constructed of sheet steel.

Corners are electrically welded.

The crossbar attached to switch blades is of steel, heavily insulated, and will not warp or bend.

Switch and cutout unit is mounted complete within the box, ready for immediate installation.

Fig. 5. No. 5351

Fig. 4. Nos. 5211E and 5251X. Switch "Locked Off"

"Square D" Steel Enclosed and Service Switches

BEAR UNDERWRITERS' FIRE AND ACCIDENT LABEL

The Underwriters' Laboratories, Inc., have inaugurated a new label service called the Casualty Label Service. The most prominent casualty insurance companies who insure under employers' liability and workmen's compensation acts, are subscribers to the merit classification service and accident prevention inspection of the Workmen's Compensation Service Bureau.

Devices labeled with the Underwriters' Fire and Accident label are not subject to charge under the analytic schedule of the Workmen's Compensation Service Bureau, but devices without this label may be responsible for a much higher rate.

The factory has been manufacturing enclosed electrical switches and motor starters for several years. It has always advocated the complete housing of all live metal parts in electrical installations, realising the danger of exposed live parts, both from fire and accident standpoints. When it learned that the Underwriters' Laboratories, working together with the Workmen's Compensation Service Bureau, were to inaugurate this new label service, it at once submitted its devices for examination and approval.

After several months' severe examination and tests, it was given permission, in May, 1915, to use the new fire and accident label on its enclosed electrical switches. Its switches were the first to be given this "safety" label privilege.

The labels are serially numbered. No. 1 was issued to that company. Their products now bearing the Underwriters' Fire and Accident label are "Square D" Steel Enclosed Service Switches, Ironclad Induction Motor Starters and Ironclad Switches.

This significant action on the part of the Underwriters' Laboratories shows to what extent they regard the importance of enclosing all live metal parts of electrical installations.

"SQUARE D" STEEL ENCLOSED SERVICE SWITCHES and Distributing Cabinets

Fig. 1. Gang Assembly of Unit Installations Showing the Flexibility of the "Square D" Steel Enclosed Service Switches

"Square D" Steel Enclosed Service Switches

"Square D" Steel Enclosed Service Switches and Distributing Cabinets are designed for service entrance installations wherever it is desirable to completely enclose all terminal wires and live parts for the advancement of Safety First principles, standardization of equipment, the prevention of tampering with circuits, the elimination of fire and accident hazards and to control non-payment consumers' supply without disconnections or removal of meters.

The patent "Lock Off" device enables the service company to make permanent installations of service entrance units. When cabinet and meter are connected with "Square D" meter protective trim, it is unnecessary to remove meter or disconnect when service is discontinued—placing switch in "off" position and locking door of cabinet prevents use of current by unauthorized persons.

Fig. 11. Nos. 2001, 2002, 2011, 2021, 2031, 2041, 2051, 2052. Showing Permanent Unit Installation of Double Compartment Cabinet with Switch Compartment Sealed Shut

Fig. 8. No. 5252 Open. Showing Quick-make, Quick-break Switch Mechanism

Double Compartment Boxes

The "Square D" line also includes double compartment boxes in 30 amperes, 125-250 volt sizes, 2, 3 and 4 circuits, with switch in one side and branch cutouts in the other.

"Square D" Enclosed Switches are built in 2, 3 and 4 pole types in standard voltages of 125, 250, 500 A.C. and 600 volt and in capacities up to and including 200 amperes.

Supply B-54

"SQUARE D" STEEL ENCLOSED SWITCHES and Steel Enclosed Service Switches

"Square D" boxes are made with openings at each end in which end plates are to be inserted to meet any desired wiring requirements and it is necessary to order end plates with each box to have the device complete.

All "Square D" Steel Enclosed Switches and end plates are divided into three classes, A, B and C, according to the depth of boxes in which switch and cutout are mounted.

Class A boxes are 3 inches deep and end plates to fit ends of Class A boxes are listed as Class A end plates.

Class B boxes are 4 inches deep and end plates to fit ends of Class B boxes are listed as Class B end plates.

Class C boxes are 5 inches deep and end plates to fit ends of Class C boxes are listed as Class C end plates.

When ordering switches be sure to specify the list numbers of end plates wanted. If end plates are not specified and unless definite instructions are given NOT to furnish switches complete with end plates we will ship and bill end plates suitable for use with switches ordered.

Priees do not include fuses or end plates. Ground wire lug for grounding switch box furnished as part of regular equipment without charge.

STANDARD END PLATES

DETACHABLE AND INTERCHANGEABLE

End plates listed are divided into three classes, A, B and C, according to depth of "Square D" boxes for which they are designed.

Class A end plates are for use with Class A boxes (3 inches deep).

Class B end plates are for use with Class B boxes (4 inches deep).

Class C end plates are for use with Class C boxes (5 inches deep).

End plates for use in end openings of the "Square D" steel enclosed switch boxes are furnished as listed below; blank, or with knockouts for use with rigid conduit, or with multiple hole porcelain outlet covers for open wiring installations.

METER PROTECTIVE TRIMS AND ADAPTER END PLATE

Meter Protective Trims

Trims listed as top trims are for use at top of "Square D" boxes. Those listed as bottom trims are for use at bottom of boxes. Reversible trims may be used at either top or bottom.

Ordinarily top trims are used at top of boxes with bottom connected meters and bottom trims at bottom of boxes with top connected meters.

List No. 1512 is a bottom trim for use with G. E. Type 1-14 or F. W. Type K-5 meters. These meters are both bottom connected and List No. 1512 trim is so designed that these bottom connected meters may be used at bottom of the box to meet special requirements.

All meter trims are made of sheet steel except List Nos. 1515 and 1516 which are of non-magnetic metal. List Nos. 1515 and 1516 are for use with high capacity direct current meters which are affected by stray magnetic fields.

If trims are required for types of meters not mentioned, quotations will be furnished on request.

All meter protective trims listed are for use with Class A boxes (3 inches deep), and when Adapter End Plate List No. 1814 is used, with Class B boxes (4 inches deep).

List No.	Meter Description	Weight Each	List Price Each

"SQUARE D" IRONCLAD FUSED SWITCHES

No. 7251
Plunger Type

No. 7253
Side Lever Type

No. 7351
Plunger Type

Standard Type

The desirability and necessity of practical accident prevention in the electrical field is now recognized by all industries. To prevent accidents has been proven good business policy.

"Square D" Ironclad Fused Switches are designed to eliminate accidents to employees, and to protect the equipment with which these devices are used.

The switches may be sealed shut to protect them against tampering or the possible use of fuses of too large capacity.

"Square D" Ironclad Fused Switches are non-hazardous. All live parts are enclosed in a cast-iron box and the mechanism is operated from outside the box by a handle.

The switch mechanism is of the quick make and quick break type. When closed, a gasket in the lid makes the box fire and fume-proof—installations may be made where exposed to water, steam, fumes or dust, without injury to the vital parts of the switch.

To replace fuses the cover is opened and the entire mechanism to which the fuses are attached swings out and away from the live parts. The fuse connections are absolutely dead and accidental contact with live parts when replacing fuses is impossible.

"Square D" Ironclad Fused Switches have proved in actual service to be positive insurance against accidents—they have enabled manufacturers to maintain production schedules by insuring minimum loss from costly shut-downs through injury to employees or machines—they have reduced the cost of fuse replacements, standardized equipment, and because of their rugged construction will outlast the machines to which they are attached.

"Square D" Ironclad Fused Switches may be locked "off" with a padlock, making operation impossible until the lock has been removed. This feature is of the greatest importance from a safety standpoint. It prevents turning on the current when repairs are being made, either to the electrical connections or to a machine driven by the motor that the switch controls.

7454	Four pole, 200	Side lever	116 lbs.	125.00

Price for solid brass padlock, brass chain, two keys, locking device and attaching to switch, \$1 per switch, net additional.

The above switches will be drilled for conduit or equipped with porcelain bushings without additional charge, but if drilling specifications do not accompany order, switches will be furnished without being drilled.

Fuses are not included in the above prices.

Approved by the Underwriters' Laboratories after examination and test under the provisions of the National Electrical Code.

"SQUARE D" IRON CLAD FUSED SWITCHES

No. 8251. Plunger Type

No. 8252. Plunger Type

No. 8253

"Severe Service" Type

WEATHERPROOF TYPE

"Square D" severe service switches are designed for outdoor use or wherever they are directly exposed to water, steam, fumes, or the roughest kind of handling.

This type embodies the features of the "Square D" plunger type switch mechanism, being instantly controlled from the outside of a cast iron box. Rubber gaskets give a waterproof design, and phosphor bronze rods, rivets and wing nuts prevent rusting. All parts are substantially made, and there is nothing whatever in this switch to get out of order.

"Square D" Ironclad Fused Switches**3 HEAT INDICATING SWITCH**

This switch was designed for a concern making laundry machines to be used on electrically heated ironing machines of large capacity.

With the main switch and the two single pole switches closed, the heating element gets full line voltage and the ironing machine gets hot quickly. To reduce the heat, the single pole switches may be opened, which cuts down the current in the heating element.

The pilot light is provided so that visual indication will be given that current is "ON."

Supply B-54

"SQUARE D" INDUCTION MOTOR STARTERS

Nos. 6251, 6361
Side Lever Type

Nos. 6351, 6451
Front Lever Type

Front and Side Lever Types

IRONCLAD—INDESTRUCTIBLE—NON-HAZARDOUS

"Square D" Induction Motor Starters (formerly "Detroit" Induction Motor Starters) are designed for use with motors up to and including $7\frac{1}{2}$ H.P. or motors which may be started by switching them directly on to full voltage service.

By using "Square D" Induction Motor Starters it is possible to properly fuse motors for their running load, the fuses being paralleled by removable short circuiting bars which are in circuit with the fuses only when switch is in the starting position.

The starters may be sealed shut to protect them against tampering or the possible use of too large capacity fuses.

"Square D" Induction Motor Starters are non-hazardous. All live parts are enclosed in a cast iron box and the mechanism is operated from outside the box by a handle.

The switch mechanism has a quick make and quick break action.

To replace fuses the cover is opened and the entire mechanism to which the fuses are attached swings out and away from the live parts. The fuse connections are absolutely dead and accidental contact with live parts when replacing fuses is impossible.

The "Square D" starter may be locked "off" with a padlock, making operation impossible until the lock has been removed. This feature is of the greatest importance from a safety standpoint. It prevents turning on the current when repairs are being made, either to the electrical connections or to a machine driven by the motor that the starter controls.

The working parts and electrical connections have great mechanical strength and are built to withstand the hard usage incident to operation under ordinary industrial conditions.

"Square D" Induction Motor Starters will be drilled for conduit or equipped with porcelain bushings without additional charge, but if drilling specifications do not accompany order they will be furnished without being drilled.

On account of the large size wires which are usually used with induction motors, the switch bases are provided with solder lugs which will take wires up to and including No. 2 B. & S. gauge.

Fuses are not included.

We furnish "Square D" Starters with padlock and locking device so they may be locked in the "off" position if desired. Price for solid brass padlock, brass chain, two keys, locking device and attaching to starter, \$1 each, net, additional.

NOTE: The inside mechanism of all "Square D" Starters is the same with the exception of List No. 6361N. The only difference between the side lever operated starters and the front lever operated type is in the location of the operating lever and the housing of the external mechanism on the side lever type.

NO-VOLTAGE RELEASE

In plants where there are a large number of motors and possibly a class of labor that cannot be depended upon to open the starters whenever the power is off, it is very desirable to have the starters provided with no-voltage release mechanism to automatically open the switch if the power fails.

In locations where the power is frequently cut off, as in many private plants that are not equipped with every safeguard for preventing interruption in service, they are a very useful device in saving the fuses as well as in making it easy to restart the power plant by removing the load from it at the moment of starting.

"Square D" Induction Motor Starters

(FORMERLY KNOWN AS "DETROIT" INDUCTION MOTOR STARTERS)

List No.		Amperes	Volts	Weight Not Boxed	List Price Each
6251	Single phase.....	30	250	20½ lbs.	\$27.55

NOTE: List No. 6361N is the same as List No. 6361, but is equipped with no-voltage release.

"SQUARE D" INDUCTION MOTOR STARTERS

Fig. 1

Fig. 2

Directions for Operating

Fig. 3

toward the operator, when the fuse (D) is withdrawn from the circuit, which opens the circuit. We call special attention to the fact that each phase of the circuit is opened at two points, thus minimizing the disruptive effects of the arc. The operating lever is now free and falls back into place on the yoke.

Figure 1 shows the interior mechanism of the "Square D" Induction Motor Starter with the lever in the starting position. To start the motor, lever (A) is pressed down by the operator as far as possible. By this action the short circuit bar (C) is shunted across the fuse (D) to take care of the heavy starting load. Connection is made across the switch jaws through the short circuit bar (C). Connections of one phase only are shown in these cuts, the others being identical. Wires from service to motor are connected to solder lugs (EE).

In Figure 2 the interior mechanism of the starter is shown in the running position. After the motor has attained full speed, the operator releases lever (A). Springs (BB) withdraw the short circuit bar (C) from the circuit, which allows the current to flow through the fuse (D) and protects the motor against overload. Please note that the short circuit bar (C) is withdrawn from the circuit without opening the circuit.

In Figure 3 the interior mechanism is shown in the off position. To stop the motor, lever (A) is pulled up, withdrawing the fuse (D) from the circuit, which opens the circuit. We call special attention to the fact that each phase of the circuit is opened at two points, thus minimizing the disruptive effects of the arc. The operating lever is now free and falls back into place on the yoke.

No. 5001. Fused Plug Receptacle with Plug. Cover Closed. Can be Locked or Sealed Shut.

No. 5021

"Square D" Fused Plug and Receptacles

"Square D" Fused Plug Receptacles are designed primarily to increase the field of activity and efficiency of portable electrical units in industrial plants and wherever it is more economical to move the units than the materials. The receptacle is made of 16 gauge sheet steel with corners electrically welded. Fuses and terminals are mounted on two porcelains held in place within the box by a steel wedge at the side. In case of accident or breakage, the porcelains may be easily removed and quickly replaced, preventing any undue loss from delay to the work in hand. The end plate at bottom is also separate and removable—another convenient feature. The receptacle may be fused for any portable unit up to 30 amperes, 250 volts capacity. After properly fusing the equipment, the receptacle may be sealed shut, thus preventing over-fusing of the circuit and consequent damage to the portable units. All electrical terminals and contacts are thoroughly enclosed. In case of emergency when the controlling switch is at a distance the receptacle is both a convenience and safeguard as the circuit controlling the equipment affected may be quickly opened by pulling the plug.

The "Square D" Fused Plug Receptacle may also be used to advantage in garages where recharging of electric storage batteries is done.

Attachment Plug

NON-REVERSIBLE POLARITY TYPE

The plug is of the polarity type, rounded on one side and so shaped that it is impossible to reverse it when inserting it in the receptacle. It is made of hardwood fitted with copper plates which make contact with the terminals attached to the porcelains within the receptacle. The cable passes through the center of the plug and is fastened to terminals at either side of the plug by means of contact screws. Worn cable may be easily and quickly removed and new cable inserted and attached.

With Inverted Semaphore Lens

Type LBA
With Inverted Semaphore Lens

Imperial Luminous Arc Headlight for Electric Traction Service

TYPE LAA

12 Inch Inverted Semaphore Lens in Door

Combination Arc and Incandescent

FOR 4 AMPERES, 575 VOLTS D.C., GROUNDED CIRCUIT

List No.	Equipment	Shipping Weight	List Price Each
24211	Headlight with plug and cable	75 lbs.	\$62.40
24213	Headlight with single end equipment	110 lbs.	88.48
24216	Headlight with double end equipment	115 lbs.	90.40

FOR 4 AMPERES, 575 VOLTS D.C., METALLIC CIRCUIT

24211MC	Headlight with two plugs and cable	75 lbs.	\$62.40
24213MC	Headlight with single end equipment	110 lbs.	89.60
24216MC	Headlight with double end equipment	115 lbs.	90.64

The above headlight when arranged for grounded circuit is equipped with one double plug, and when arranged for metallic circuit is equipped with one double and one single plug. If specified on the order, two single plugs will be furnished in place of double plug, without extra charge. The incandescent circuit of above headlight is arranged for two 56 watt, 115 volt Mazda lamps, which burn in series, and this arrangement will always be furnished, unless otherwise specified on order. If specified on the order, the above headlight will be arranged for any Edison base incandescent lamp from 23 to 94 watts, 115 volts, without extra charge.

TYPE LBA

12 Inch Inverted Semaphore Lens in Door

Arc Only

FOR 4 AMPERES, 575 VOLTS D.C., GROUNDED CIRCUIT

List No.	Equipment	Shipping Weight	List Price Each
24311	Headlight with plug and cable	70 lbs.	\$56.72
24313	Headlight with single end equipment	105 lbs.	81.68
24316	Headlight with double end equipment	110 lbs.	88.48

FOR 4 AMPERES, 575 VOLTS D.C., METALLIC CIRCUIT

24311MC	Headlight with two plugs and cable	70 lbs.	\$56.72
24313MC	Headlight with single end equipment	105 lbs.	82.80
24316MC	Headlight with double end equipment	110 lbs.	90.72

The above headlight, when arranged for grounded circuit, is equipped with one single plug, and when arranged for metallic circuit is equipped with two single plugs.

Multiple break switch HL-1108 is regularly furnished with headlight equipments 24313 and 24316. Reversing switch HL-1508 is regularly furnished with headlight equipments 24313MC and 24316MC, as it permits reversing of current through the headlight, thereby dimming the light. If specified on the order, equipments 24313MC and 24316MC will be furnished with three-lead resistance HL-5601, at an increase of \$4.56 in list price. Reversing switch HL-1518 must be used with the three-lead resistance. The three-lead resistance reduces the current consumption 35% and dims the light more effectively than the two-lead resistance.

General

The above headlights can be furnished for any voltage up to 1500. List prices for above headlights arranged for voltages other than standard will be quoted upon request.

The above headlights will be furnished with inverted or regular semaphore lens in door, if specifically ordered, without extra charge.

If specified on the order, the above headlights will be furnished with "Noglar" inverted or regular semaphore lens in door, at an increase of \$5.60 in the above list prices.

The above headlights are regularly furnished with hangers 6 inches on center. If specified on the order, special hangers will be furnished, without extra charge. Specifications for special hangers should be submitted for approval before ordering.

The above list prices include one upper and one lower electrode.

Dimensions: Height, 15 inches; width, 15 inches; depth with inverted semaphore lens, 12 inches; depth with regular semaphore lens, 14 inches; shipping dimensions of complete equipment, 34 x 21 x 19 inches.

Delivery F. O. B. point delivered plus some charges. For some charges write nearest house.

The above headlights will take any 23 to 56 watt standard concentrated filament Mazda lamp. The headlights are furnished with an adjustable lamp receptacle bracket, which makes it easy to properly focus the lamp. This is a desirable feature, because of the variation in the light centers of concentrated filament Mazda lamps.

If specified on the order, the above headlights will be furnished with "Noglare" glass in door, at an increase of \$3.44 in the above list prices.

If specified on the order, the above headlights will be furnished with plate glass in door, at an increase of 80 cents in the above list prices.

Above list prices do not include incandescent lamp.

Delivery F. O. B. Factory, Syracuse, N. Y. For warehouse deliveries write nearest house.

The above headlights will take any 23 to 56 watt standard concentrated filament Mazda lamp. The headlight is furnished with an adjustable lamp receptacle bracket, which makes it easy to properly focus the lamp. This is a desirable feature, because of the variation in the light centers of concentrated filament Mazda lamps.

If specified on the order, the above headlight will be furnished with "Noglare" glass in door, at an increase of \$3.44 in the above list prices.

If specified on the order, the above headlight will be furnished with plate glass in door, at an increase of 80 cents in the above list prices.

Above list prices do not include incandescent lamp.

Delivery F. O. B. Factory, Syracuse, N. Y. For warehouse deliveries write nearest house.

C-H HEADLIGHT ACCESSORIES

Crouse-Hinds Two-way Multiple Break Switch with Cover Removed

Crouse-Hinds Two-way Multiple Break Switch with Cover Removed

The multiple break switch is a distinct improvement over the snap switch. It is for use with headlights or on any circuit not over 600 volts and 10 amperes capacity.

The base is made of a strong composition which is practically impervious to moisture and is not affected by heat. The crossbar which holds the contact blades, is made of the same composition as the base.

Knife blade and corresponding beveled contacts are used. The ends of the blades are so shaped that when the switch is being closed or opened, the lower edges of blades and tops of clips are parallel. This is a feature of considerable importance, as instant contact or release is obtained along the full width of contact. This form of construction eliminates damage to blades and contacts, which occurs where a point on the edge of the blade touches only a corner of the contact when the switch is being opened or closed.

These switches are made in four styles—one-way, two-way, reversing for two-lead resistance and reversing for three-lead resistance. The one-way is for use with straight arc headlights, heaters, pump motors and lighting circuits. The two-way style is for use with combination arc and incandescent headlights. The reversing switches make it possible to reduce the light beam of an Imperial Luminous headlight by reversing the direction of the current through the electrodes. All four styles of switches are the same except in the connections.

Two styles of knob handles—quick-removable and regular—are made for these switches. The quick-removable handle can be taken off by exerting a moderate pull, and put on again with an equal pressure. This can only be done, however, when the switch is in an open position. Some railway electricians consider the removable handle an advantage for double end equipments, in that it discourages unauthorized persons from attempting to operate the switch.

With Regular Handle

List No.	Description	List Price Each
HL-1108	One-way multiple break switch	\$5.68
HL-1408	Two-way multiple break switch	5.68
HL-1508	Reversing multiple break switch, for two-lead resistance	5.68
HL-1518	Reversing multiple break switch, for three-lead resistance	5.68

With Quick-removable Handle

HL-120	Wire, for resistance HL-2117	4.48
HL-2115	Complete resistance, 4 amperes, 550 to 575 volts, 117 ohms (two-lead)	15.84
HL-2116	Resistance tube and wire, for resistance HL-2115	1.60
HL-115	Wire, for resistance HL-2115, per lb.	4.48
HL-2119	Complete resistance, 4 amperes, 250 volts, 43 ohms (two-lead)	11.36
HL-2116	Resistance tube and wire, for resistance HL-2119	1.60
HL-115	Wire, for resistance HL-2119, per lb.	4.48
HL-2598	Complete resistance, 2 amperes, 550 to 575 volts, 190 ohms (two-lead)	15.84
HL-2599	Resistance tube and wire, for resistance HL-2598	1.44
HL-599	Wire, for resistance HL-2598, per lb.	4.48
HL-5600	Complete resistance, 2 amperes, 250 volts, 70 ohms (two-lead)	11.36
HL-2599	Resistance tube and wire, for resistance HL-5600	1.44
HL-599	Wire, for resistance HL-5600, per lb.	4.48
HL-5601	Complete resistance, 4 amperes, 550 to 575 volts, 117 to 170 ohms (three-lead)	20.40
HL-2118	Resistance tube and wire, for resistance HL-5601	1.92
HL-120	Wire, for resistance HL-5601, per lb.	4.48
HL-116	Porcelain tube, for resistances HL-2117, 2115, 2119, 2598, 5600, 560164

Wiring Equipment Parts

HL-2105	Single plug receptacle, complete	\$1.12
HL-105	Porcelain block, for receptacle HL-210564
HL-2141	Double plug receptacle, complete	2.24
HL-141	Porcelain block, for receptacle HL-2141	1.28
HL-2108	Plug receptacle complete, less porcelain block, for HL-2105 and HL-214180
HL-110	One-way snap switch	1.36
HL-140	Two-way snap switch	2.72
HL-133	Fuse block, new style (standard), for N. E. C. cartridge fuse	1.36
HL-113	Fuse block, old style, for Type A cartridge fuse	1.36
HL-134	Fuse, 600 volts, 6 amperes, for fuse block HL-13396
HL-114	Fuse, 600 volts, 6 amperes, Type A, for fuse block HL-11396

How the Western Electric Company Helps Its Agents

The profitable sale of electrical commodities is largely a matter of good retail merchandising.

The Western Electric Company, in seeking the business of the dealer, offers both in volume and variety, a degree of coöperation that is unequalled by any other distributor of electrical supplies.

Here is a synopsis of what the Western Electric Company will do for an agent:

1. Furnish a supply of stuffers, booklets, post cards and other literature designed for mailing direct to the local trade. These will be imprinted with the dealer's name.
2. Supply the dealer, imprinted with his name, attractive cards for street-car advertising.
3. Furnish lantern slides imprinted with the dealer's name for use in moving picture theaters. These are attractive and cover our entire line of advertised specialties.
4. Furnish sets of window cards and complete instructions for making the show window a real business puller.
5. Furnish electrotypes for local newspaper advertising. The use of these identifies the dealer as the local distributor of high-quality electrical products marked with the widely advertised name "Western Electric."
6. Refer inquiries originating in his territory for the dealer to follow up. Our extensive national advertising is creating a wide demand for our products, but we prefer to accept no business direct. All of this advertising directs the reader to the electrical dealer. We must have, therefore, in every community a live dealer with up-to-date merchandising and sales methods, anxious to identify himself as the local Western Electric representative.

On the following pages you will find cataloged the various dealers' helps that we are prepared to furnish. These are all furnished free—order by number. If the dealers' helps shown here do not meet with your ideas and local conditions, let us prepare something especially designed for your use.

TELEPHONE EQUIPMENT

We here describe the standard types of Western Electric telephones and switchboards. The choice of any particular apparatus to meet specific conditions is more or less a matter of personal preference. The following general principles, however, are intended as guides in selecting suitable equipment.

Selection of Equipment

INTER-PHONE SYSTEMS

Intended to provide communication between various points in one or several buildings without necessitating a connection through a telephone switchboard. From 2 to 24 stations may be used together. No operator is required, as the signaling and talking circuits can be controlled from any station. The ideal system where there is much intercommunication in or between buildings and no outside calls to an exchange.

Index

The various systems for which Inter-phones are adapted are as follows:

Two Stations Only. Two line wires. System No. 14.

Two to Six Stations. Code ringing—common talking. Three to four line wires. System No. 15.

Three to Nine Stations. Selective ringing—common talking. System No. 11.

One Master Station and not more than twelve outlying stations. System No. 12.

One Central Station and any number of outlying stations. Two to three line wires. System No. 16.

Three to Twenty-four Stations. Selective ringing and talking between all stations. System No. 1.

A System Allowing Secret Conversations. Between certain stations, being a modification of System No. 1. System No. 4.

Apartment-House System, providing service between the vestibule and apartments. System No. 7.

Apartment House System, providing service between the (a) vestibule and apartments; (b) apartments and the janitor; (c) vestibule and janitor. System No. 8.

Apartment House System, providing service between the (a) vestibule and apartments; (b) vestibule and janitor; (c) apartments and janitor; (d) apartments and tradesmen. System No. 9.

Apartment House System, adapted to large buildings, similar to System No. 9. System No. 10.

A Mechanical General Alarm or Code Signaling System, providing a mechanical means of signaling by ringing a system of bells by code.

Inter-phone Outfit Sets 14A and B, 15A and B and 16A and B.

SWITCHBOARDS

We are prepared to furnish telephone switchboards of any size or capacity. The scope of this type of equipment is so broad that it is not possible to go into any detail in this catalog, but we will be glad to submit a proposition upon receipt of specifications or to have our engineers call and give you any information you may desire.

PRIVATE EXCHANGE SWITCHBOARDS

Intended primarily to provide communication between various points in one or several buildings, but in addition may be secured without or with provision for connection to a general public telephone exchange (either magneto or central battery).

No. 1801 Switchboard is a unit type board, to which may be connected from 20 to 100 stations. The units fit together like a sectional bookcase, each unit having a capacity of 20 lines. This feature makes it possible to secure a board of 20 lines and to increase its capacity up to 100 lines at any time by simply adding units. This type of board is usually operated by elevator operators, janitors, office boys, stenographers or clerks, and is suitable for apartment houses, hotels, Y. M. C. A. buildings, manufacturing establishments, schools, hospitals, asylums, prisons; in fact, anywhere where there is a large percentage of intercommunication in or between buildings and only a small percentage of outside calls to an exchange.

Cordless Private Branch Exchange Switchboards. The connecting key apparatus is mounted in a small wooden cabinet which may be placed on an ordinary desk or table. In general use where the operator has other duties to perform, and particularly recommended for those small systems having 7 stations or less where a large percentage of calls is to be connected to a general public telephone exchange.

Private Exchange Switchboards (Nos. 1260 to 1290). Are recommended for those systems having 40 or more up to 300 stations. They are constructed to be used where the operator is exclusively busy answering calls and is not supposed to perform clerical duties.

Private Exchange Switchboards (Nos. 1300 to 1350). Provided for conditions similar to those met by the Nos. 1260 to 1290 switchboards but where the operator has clerical duties to perform in addition to answering calls. The board is arranged with a large writing surface and has either one or two tiers of drawers.

SELECTION OF EQUIPMENT—Continued

MAGNETO SWITCHBOARDS

Intended to provide service in small public telephone exchanges having 10 or more up to 300 subscribers.

Magneto Wall Cabinet Switchboards (Type No. 1012). This is the smallest type of switchboard we manufacture and is entirely satisfactory for exchanges having 10 subscribers' lines or less, where the switchboard is without a regular attendant, as when located in a store. The cabinet has a capacity of 10 subscribers' lines and 4 cord circuits but no toll lines. Ringers are used in place of drops.

Magneto Wall Cabinet Switchboards (Type No. 106). This wall cabinet switchboard is similar to type No. 1012 and is entirely satisfactory for exchanges having 10 subscribers' lines or less and where the switchboard is under steady supervision. The cabinet has a capacity of 10 subscribers' lines, 4 cord circuits and 1 toll line. Drops are used in place of ringers.

Sectional Unit Type Switchboards (Type No. 1800). Particularly developed to provide service for the small, rapidly growing telephone exchange having a maximum capacity of 50 lines. The board consists of units which fit together like a sectional bookcase, making it possible to secure an equipment to take care of 10 lines or less but which can be increased to 50 lines at any time by simply adding units. There are units arranged to give every class of service desired.

Non-multiple Magneto Switchboards. These switchboards are designed for the medium size magneto exchange. The smallest board (No. 1200) has a capacity of 60 lines and the largest (No. 1250) a capacity of 330 lines. Additional capacity can be secured by lining up a number of these switchboard sections. However, non-multiple magneto equipment is not recommended for exchanges of more than 330 lines.

CENTRAL BATTERY SWITCHBOARDS

Non-multiple Convertible Central Battery Switchboards. These switchboards are so designed that they can be used originally for magneto service, and can be converted at will for central battery operation. They are furnished in 165 and 330 line capacities.

Non-multiple Central Battery Switchboards. These switchboards are for central battery telephone systems where the ultimate equipment will not exceed 500 lines. This kind of lamp signal, non-multiple switchboard is arranged with or without magneto toll and rural lines ending in combined jacks and signals. Those switchboards equipped with magneto lines have a portion of the cords arranged for combination operation; that is, the answering end is arranged to operate with magneto lines and the calling end with either central battery or magneto lines.

TELEPHONES

These are classified in this catalog as follows:

(a) **Magneto Telephones.** These telephones are, sometimes called local battery telephones. For use in connection with magneto switchboards in small towns or rural systems, or on private lines where two or more instruments are used to communicate with each other. Each instrument requires two or three dry batteries to furnish the necessary talking current. Signaling is accomplished by turning the crank of a magneto generator with which each instrument is equipped.

(b) **Telephones for Use With No. 1801 Switchboards.** These telephones are especially arranged and adapted for use with the No. 1801 Private Exchange Switchboard System.

(c) **Central Battery Telephones.** For use in all standard central battery telephone systems including private exchanges and P. B. X. systems of the central battery class.

In central battery systems it is only necessary to lift the receiver of the telephone instrument from the hook in order to attract the attention of the operator.

(d) **Mine Telephones.** The Western Electric mine telephone is a special adaptation of the world's standard "Bell" telephone, constructed to meet the exacting conditions of mine service.

The metal used is fireproof, moisture-proof and rustproof.

With the mine telephone any part of the mine—above or below ground—can be reached at any moment. Trains can be intercepted at any point and instructions can be changed immediately to meet any new condition. A mine telephone installation will save you unnecessary delays, will prevent accidents, and will enable you to carry on all operations in harmony with each other.

Our mine telephone engineer will gladly give you complete data on that system which is particularly suitable for your mine. We have not attempted here to list the apparatus in detail, but wish to solicit your inquiries.

(e) **Railway Telephones.** As with the mine telephone equipment, we find it manifestly impossible to show all types and combinations of railroad telephone apparatus, but prefer that you take up with our engineer the special problem in hand.

One of the important factors to be considered in the purchase of railway telephone apparatus is the certainty of a permanent source of supply, both for repairs and additional parts.

MISCELLANEOUS TELEPHONE APPARATUS AND ACCESSORIES

There is a Western Electric type of telephone to satisfactorily meet all standard service conditions. For special requirements, such as pole service, fire service and railways, there are special instruments.

Over 8,000,000 Western Electric telephones are in daily use throughout the world, handling efficiently both local and long distance telephone messages.

Our enormous output enables us to purchase our raw material in large quantities at a low cost. This, together with unequalled manufacturing facilities, makes it possible for us to offer our standard telephones at most reasonable prices. We solicit your inquiries.

Telephone Equipment

HAND-SET TYPE INTER-PHONES

The Hand Set, or Hand Microphone as it is sometimes called, is often more convenient than the ordinary wall or desk telephone, and is preferred by many telephone-users, as it can be held and operated with either hand, leaving one hand free.

It is compact, light, and inexpensive, and can be hung on a hook or laid down in any position when not in use.

Hand Set Inter-phones are of two general types, flush and non-flush, as applied to the method of mounting the apparatus box. These are made up as follows:

FLUSH TYPE

- (a) Hand Set
- (b) Flush apparatus box made up of:
 - 1 flush plate (brush brass) No. 12007 W. E. Catalog
 - 1 wall box No. 110985 W. E. Catalog
 - 1 Apparatus Unit No. 382

NON-FLUSH TYPE

- (a) Hand Set
- (b) Non-flush apparatus box No. 383

These two types cover the equipment in general, but there are special features, such as Hand Sets equipped with plugs, long extension cords for bed service, etc., discussed under the systems following.

The contractor's attention is called to the use of standard boxes and face plates, as described below.

The Hand Set

We manufacture two general types of hand sets for Inter-phone service, known as No. 1003-A and 1003-B.

Both of these hand sets are equipped with a grip push bar which is operated by grasping the handle firmly. The operation of this "grip" opens one contact and closes another, performing the function of a switch hook. It is marked "Press to Talk."

The "B" hand set differs from the "A" in that it has, in addition to the "grip," above described, a white button for ringing or signaling the distant station. When operated, it opens one and closes one contact.

The No. 1003-A and No. 1003-B hand sets are uncorded. When corded they are assigned designating code letters and are adapted to the various systems later described.

Associate Apparatus

An Apparatus Box, in which are mounted the signaling buzzer and the connecting terminals for the wires, must be associated with the Hand Set in order to complete the Inter-phone. These apparatus boxes are furnished in two types, viz.: Flush and Non-flush.

Flush Apparatus Box: This consists of three parts: the Wall Box, the Apparatus Unit, and the Face Plate.

An important point to be observed is that the Wall Box and the Face Plate are the same as used in electric-light wiring for push-button switches. This feature is of special importance to the contractor, since it allows him to draw on his own stock for these parts. For this reason, we are prepared to furnish sets complete, including wall box and flush plate, or minus these parts, as desired.

Non-Flush Apparatus Box: This box is intended for use in buildings where it is not convenient to mount the flush type. Finished in dull black with nickel trimmings. Approximate size, 3 1/4" diameter by 1 1/8" deep.

Telephone Equipment

INTER-PHONE SYSTEM NO. 15

Code Ringing, Common Talking

A common talking, code-ringing system arranged for two to six stations. Three wires are required when there are only two stations. When there are more than two stations, four wires are necessary. **ONE STATION MUST HAVE A RETARDATION COIL.** Also, where there are more than two stations, the retardation coil set should be located as near the center of the system as possible.

ONE SET OF BATTERIES ONLY IS REQUIRED, WHICH MUST BE CONNECTED TO THE SYSTEM THROUGH THE RETARDATION COIL OR BATTERY STATION.

INTER-PHONE SYSTEM NO. 11

Selective Ringing, Common Talking

Instruments are furnished in 4- and 8-button sizes, having capacities of 5- and 9-stations respectively. Three common wires and one individual wire for each station are necessary. One station, located preferably near the center of the system, must have a retardation coil. One set of batteries is required, which must be connected to the system through this retardation coil station.

WALL SETS

No. 1327 type. These are compact instruments, having golden oak cabinets with nickel trimmings $5\frac{3}{4}$ inches wide by $6\frac{1}{4}$ inches long by $3\frac{1}{4}$ inches deep. Equipped with 1 No. 179-W receiver, 1 No. 394-W transmitter, 1 No. 360-2½ ft. receiver cord, and 1 No. 101398 bell. In addition to the above equipment, the battery station instruments Nos. 1327-J and -L are equipped with 1 No. 51-C retardation coil.

Code No.	Capacity	Use	List Price Each
1327-J	4-buttons	Battery station only.....	\$12.40
1327-K	4-buttons	Non-battery stations only.....	11.80
1327-L	8-buttons	Battery station only.....	13.50
1327-M	8-buttons	Non-battery stations only.....	13.00

No. 1339 type. A flush mounting metal case instrument, face plate regularly finished in brush brass. Metal wall box is included.

Equipped with 1 No. 180-W receiver, 1 No. 294-W transmitter, 1 No. 360-2½-ft. receiver cord, and 1 No. 101400 bell. In addition to the above equipment, the battery station instruments Nos. 1339-B and -D are equipped with 1 No. 51-C retardation coil.

Size of face plate:

4-button— $5\frac{1}{8}$ in. wide by $8\frac{1}{8}$ in. long
8-button— $5\frac{1}{8}$ in. wide by $9\frac{1}{8}$ in. long

Size of wall box:

4-button— $3\frac{1}{8}$ in. wide by $6\frac{5}{8}$ in. long by $2\frac{3}{8}$ in. deep
8-button— $3\frac{1}{8}$ in. wide by $7\frac{1}{8}$ in. long by $2\frac{3}{8}$ in. deep

1339-B	4-buttons	Battery station.....	\$17.60
1339-C	4-buttons	Non-battery stations.....	16.90
1339-D	8-buttons	Battery station.....	22.00
1339-E	8-buttons	Non-battery stations.....	21.40

DESK SETS

No. 6034 type. These desk Inter-phones consist of 1 No. 8 type connecting block, 1 No. 11-B bell, and a standard black finish desk stand with ringing buttons in the base, equipped with 1 No. 179-W receiver, 1 No. 302-W transmitter, 1 No. 360-3 ft. receiver cord, 1 No. 494-9½ in. transmitter cord, 1 No. 466-10½ in. transmitter cord, and 1 No. 495-6 ft. 2 conductor cord. In addition the No. 1020-AS 4-button stand is equipped with 1 No. 497-6 ft. 5 conductor cord, and the No. 1020-AT 8-button stand with 1 No. 496-6 ft. 9 conductor cord.

6034-BB	8-button	No. 111073	No. 432		Non-battery station only.....	16.80

Battery Requirements

Four to five Blue Bell dry cells are required when the wire distance between the two sets farthest apart is 750 feet or less, and the line wire composed of No. 22 B. & S. gauge copper conductors. On lines of greater length it is recommended that instead of increasing the number of battery cells to more than 5, larger wire be used as follows:

750-1000 feet—No. 20 B. & S. gauge
 1000-1500 feet—No. 18 B. & S. gauge
 1500-2500 feet—No. 16 B. & S. gauge

Connecting Diagrams and Schematics

Connecting Stations

- 1st Operation: Connect the cable conductors exactly the same at all stations.
- 2nd Operation: Then reverse the wires connected to terminals marked H and 1 at station 1; H and 2 at station 2; H and 3 at station 3, etc., up to the last station where no changes should be made.

Complete Connection Diagram furnished with each Inter-phone

INTER-PHONE SYSTEM NO. 12

Master and Outlying Stations

Intended for schools, mercantile establishments, etc., where it is desired to call and be called from a central point, or master station. The master station can call any of the outlying stations selectively, or the outlying stations can call the master station, but cannot call each other. Three common and one individual conductors are required between the master station and the outlying stations. Only one set of batteries is required, which must be located near the master station.

MASTER WALL SETS

No. 1327 Type. These are compact instruments having golden oak cabinets with nickel trimmings, and measure $5\frac{3}{4}$ inches wide by $6\frac{1}{2}$ inches long by $3\frac{1}{4}$ inches deep.

Equipment includes 1 No. 179-W receiver, 1 No. 294-W transmitter, 1 No. 360-2½ foot receiver cord, 1 No. 101398 bell, and 1 No. 51-C retardation coil.

Battery Requirements

Three to five Blue Bell dry cells are required on lines up to 750 feet composed of No. 22 B. & S. gauge copper wire. On lines of greater length it is recommended that instead of increasing the number of battery cells to more than five, larger wire be used as follows:

750-1000 feet—No. 20 B. & S. gauge
1000-1500 feet—No. 18 " "
1500-2500 feet—No. 16 " "

Schematic No. 6043-E

Complete Connection Diagram furnished with each Inter-phone Telephone Equipment

INTER-PHONE SYSTEM NO. 16

Master and Outlying Telephones

This system provides communication between one centrally located telephone called the master station and one or more up to any number of outlying telephones. The service is particularly adapted for homes, small hotels, public buildings, offices, warehouses and factories, where it is desirable to communicate from different rooms to a central point, and vice versa.

Two kinds of service can be obtained with this system by specifying the proper equipment:

First. One-way Service, which means that any one of the outlying telephones can signal and carry on a conversation with the centrally located master telephone, but the master telephone cannot signal the outlying telephones.

Second. Two-way Service, which means that any one of the outlying telephones can signal and converse with the master telephone, and the master telephone can signal and converse with any one of the outlying telephones selectively as desired.

No provision, however, is made for the outlying telephones to call each other.

For connecting the instruments only a small number of wires are required, which can be run at a cost very little greater than necessary to install an ordinary bell or annunciator system. In case bell or annunciator wiring is in existence, it is possible to connect the inter-phones to it, thereby reducing the cost of installation.

For one-way service only two wires are required—one common and one individual—between the master and each of the outlying telephones.

For two-way service, three wires are required—one common and two individual—between the master and each of the outlying telephones.

The master telephone consists of a hand set and an annunciator equipped with a number of drops—one for each of the outlying telephones. In case two-way service is required the annunciator cabinet is also equipped with a number of push buttons—one for each of the outlying stations.

The outlying telephone consists of a hand set and an apparatus box. The hand set contains a push button, which, when depressed, signals the master telephone. The apparatus box contains connecting terminals and other necessary accessories and can be furnished in two types: non-flush type or flush type.

With the non-flush apparatus box a hand set cord is permanently fastened to the apparatus box terminal. With the flush apparatus box the hand set cord terminates in a plug, which can be inserted into a jack mounted in the apparatus box, in this way establishing instant connection with the system.

In wiring buildings for electric bells, future provision for an inter-phone system can be made at very little expense by installing instead of the usual push buttons our flush apparatus boxes containing push button and jack and consisting of one No. 110985 wall box, one No. 12007 face plate and one No. 382C apparatus unit. In place of the ordinary bell our one-way annunciator containing drops and bell should be installed (the code number of the annunciator depending upon the number of drops: one drop necessary for each push button). The wiring for these instruments is the same as used for any ordinary call bell equipment.

With this apparatus installed, simple call bell service can be obtained. At any time the system can be converted to provide telephone service by purchasing the requisite number of hand sets and connecting them by simply inserting the hand set plug into the jacks of the push button plates already installed. There will be no new wires to run or batteries to buy. Everything will remain the same as before except the added convenience of the telephone.

Hand-set extension cords can be furnished so that in cases of illness or other necessity the hand set can be carried to the bed or other point at a distance from the apparatus box. The first extension cord added increases the standard length of the hand-set cord from three feet to eleven feet, and each additional length added increases it eight feet.

Only one battery is required, which should consist of 3 to 4 Blue Bell dry cells to be used on lines up to 200 feet composed of No. 22 B & S gauge copper wire. On lines of greater length, it is recommended that instead of increasing the number of dry cells to more than 4, larger wire be used as follows:

250 to 400 feet—Use No. 20 B & S gauge copper wire.

400 to 600 feet—Use No. 18 B & S gauge copper wire.

600 to 1000 feet—Use No. 16 B & S gauge copper wire.

INTER-PHONE SYSTEM NO. 16 (Continued)

No. 360005 Master Station Two-way Service

No. 360011 Master Station One-way Service

Master Station

Consists of an annunciator and a No. 1003D Hand Set. The code numbers and prices listed below cover the annunciator only. The No. 1003D Hand Set should be ordered separate.

The finish of the annunciator is golden oak; however, light or dark oak finish can be furnished without additional charge.

For two-way service the annunciator must have ringing buttons—one for each outlying station.

For one-way service the ringing buttons are not necessary.

Complete Connection Diagram furnished with each Inter-phone

INTER-PHONE SYSTEM NO. 1

General

For general use where a high grade of intercommunication is desired, System No. 1 is recommended. It permits of any station calling any other, and is absolutely non-interfering. That is to say, as many conversations can be carried on at one time as there are pairs of stations, without any conversation interfering with another. All Inter-phones listed under this system are suitable for either "full metallic" or "common return" wiring. We recommend "full metallic" because of its absolute freedom from cross-talk. There can be as many stations in the system as there are buttons on the Inter-phone sets. No extra button is required for ringing, because each button, when depressed to its extreme position, puts ringing current on the line.

No. 1324 Type. Wall Set

Wiring

The wiring consists, in full metallic circuits, of 2 No. 22 B. & S. gauge wires for each station, plus 4 No. 16 B. & S. gauge battery wires for the system.

In common return circuits the wiring consists of 1 No. 22 B. & S. gauge wire for each station, plus 3 No. 16 B. & S. gauge battery wires for the system.

For example: A 12-station metallic circuit system requires 24 No. 22 B. & S. gauge and 4 No. 16 B. & S. gauge wires.

A 12-station common return system requires 12 No. 22 B. & S. gauge and 3 No. 16 B. & S. gauge wires.

We carry a full line of cable for system No. 1.

WALL SETS

No. 1324 Type. An all metal set having a hinged face, movable transmitter and hand receiver. Black finish with nickel trimmings. Furnished in 6 and 12-button capacities only.

Equipped with 1 No. 143-AW receiver, 1 No. 311-W transmitter, 1 No. 101398 bell, 1 No. 10- 3 foot receiver cord and 1 No. 51-C retardation coil.

6016-N	16 buttons	328-G	35.50
6016-P	20 buttons	328-H	38.30

Size of Key Box

Size of key box: 6 and 12-button, 5 inches wide by 7½ inches long by 2½ inches deep.

Size of key box: 16, 20, and 24 button, 5¼ inches wide by 10¼ inches long by 2½ inches deep.

HAND SETS

If it is desired to use a hand set instead of the standard desk stand furnished with the above No. 6015 sets, either the No. 1001-J or 1002-D Hand Sets can be used.

In the majority of cases the No. 1001-J will be found preferable and is recommended.

Battery Requirements

Two separate sets of Blue Bell dry cells are required: 1 set for talking and 1 set for ringing.

Use 5 Blue Bell dry cells for the talking circuit in all cases.

For the ringing circuit, the following number of Blue Bell dry cells will be required when the distance between the stations farthest apart does not exceed the lengths given below. This information is based on the use of standard Inter-phone cable Nos. 164-150 (No. 22 B. & S. gauge line wires and No. 16 B. & S. gauge battery feed wires).

Lengths of Line	No. of Cells
300 feet	4
1000 feet	5
1500 feet	7

Telephone Equipment

APARTMENT HOUSE INTER-PHONES

Systems Nos. 7, 8, 9 and 10

INTRODUCTORY

At the present time two different methods of communicating between the vestibule and suites of apartment houses are in use, the first being the speaking tube and the second the telephone. Between

No. 1262. Vestibule Inter-phone with Letter Boxes

the two there is everything to be said in favor of the telephone. Speaking tubes are antiquated because they are unsanitary, unflexible, and uneconomical in the long run. The speaking tube does not have one advantage over the telephone for apartment house intercommunication, and the time will come very shortly when speaking tubes will be only a remembrance to architects and builders of apartment houses.

General Information. The telephone systems described herein are designed for use in all apartment buildings in which branch exchange telephone switchboards cannot be installed for economic reasons. The systems throughout are planned with the utmost care so that the actual work of installing is reduced to a minimum, and the telephone sets are of neat and attractive design.

The following points are pertinent in their application to apartment house service:

1. The Apartment House Inter-phone System removes the necessity for a hall boy. It is always on the job night or day, and its up-keep is insignificant in comparison with the hall boy's wages.
2. The Apartment House Inter-phone System takes the place of speaking tubes. It does all that speaking tubes can possibly do and in addition is perfectly flexible so that it can be added to with no inconvenience, and is sanitary and economical in the long run. Its cost of installation as compared to the cost of installing a speaking tube system of similar comprehensiveness is much less and the appearance of the vestibule is better.
3. The circuits of Western Electric Apartment House Inter-phone Systems are especially adapted to this class of work, the talking current being fed separately through retardation coils at the janitor's, tradesmen's and vestibule Inter-phone sets. The retardation coils are bridged by condensers so that the transmission circuits are perfect. There will not be the least interference in conversations taking place simultaneously between each of the three master stations and three different apartments.
4. A door opener button, in addition to a janitor's button, is provided on the Suite Wall Sets, and the circuits are so arranged that the regular telephone ringing battery can be used for operating the door opener, thus eliminating a set of batteries which would otherwise be required.
5. Only two individual wires are required to each apartment and one common wire throughout the system.
6. One Janitor's Equipment can be made to serve any number of vestibules and apartments up to a sum total of seventy; that is to say, if the same janitor serves several buildings, each having one or more vestibule entrances, or one building having several vestibule entrances, but one Janitor's Equipment is required for the whole system.
7. With each telephone set a complete wiring diagram is furnished.
8. All telephone sets and all accessories necessary for the complete installation are provided with screw connections so that an entire system can be installed without the use of a soldering iron.

APARTMENT HOUSE SYSTEMS

Apartment House Inter-phones are furnished in four different systems as follows:

- System No. 7—Provides service between the vestibule and the apartments.
- System No. 8—Provides service between the { vestibule and the apartments.
vestibule and the janitor.
apartments and the janitor.
- System No. 9—Provides service between the { vestibule and the apartments.
vestibule and the janitor.
apartments and the janitor.
tradesmen and the apartments.

System No. 10—Provides the same service as system No. 9, but on a larger scale.

The systems are flexible, being adapted to expansion from one system into another without making any changes in the apparatus other than supplying additional equipment. Electric door openers can be supplied for any system to be operated by a push button on the suite sets.

SUITE HAND SETS

The flush sets are either equipped with one or two ringing buttons. If equipped with one, this ringing button is in the apparatus unit and can be used for either calling the janitor or operating the electric door opener. A separately mounted push button can also be used with this set as described above. If equipped with two buttons, the one in the hand set is used for operating the door opener, and the one in the apparatus unit for calling the janitor.

It should be noted that the non-flush sets are provided with only one ringing button, which can be used for either calling the janitor or operating the electric door opener. When two ringing buttons are required with the non-flush set, a separate push button must be used.

VESTIBULE SET

No. 1362 Type. Flush mounting, brush brass finish vestibule set, equipped with 1 No. 180-W receiver, 1 No. 294-W transmitter, 1 No. 360-2½ foot receiver cord.

Furnished as listed below in 7, 13, 17, 21, and 25-button sizes. (The odd button is for janitor's line.) Intermediate sizes can be furnished on order at the price of the nearest larger size.

The 7 and 13-button vestibule sets are designed to mount alongside of a group of two-nest letter boxes No. 12013.

The 17, 21, and 25-button sets are designed to mount alongside of a group of four-nest letter boxes No. 116937.

Size of face plate:

7 and 13-button sets, 7½ inches wide by 11½ inches long.

17, 21, and 25-button sets, 7½ inches wide by 16½ inches long.

Size of wall box:

7 and 13-button sets, 5¼ inches wide by 8¾ inches long by 3½ inches deep.

17, 21, and 25-button sets, 5¼ inches wide by 12¾ inches long by 3½ inches deep.

Code No.	Capacity	List Price Each
1362-G	7 buttons	\$36.80
1362-H	13 buttons	41.30
1362-D	17 buttons	45.00
1362-E	21 buttons	49.40
1362-F	25 buttons	53.80

JANITOR'S SET

No. 1350 Type. Golden oak cabinet with nickel and black trimmings.

Equipped with 1 No. 179-W receiver, 1 No. 294-W transmitter, 1 No. 360-2½ foot receiver cord and 1 No. 1-L resistance coil. No ringer is provided, as a bell is furnished with the annunciator which must be used with this set.

Furnished as listed below in 7, 13, and 25-button sizes only. (The odd button is for the vestibule line.)

Size of cabinet:

7 and 13-button sets, 6½ inches wide by 9¾ inches long by 4 inches deep.

25-button set, 7½ inches wide by 13¼ inches long by 4 inches deep.

Code No.	Capacity	List Price Each
1350-A	7 buttons	\$19.50
1350-E	13 buttons	22.90
1350-G	25 buttons	29.60

JANITOR'S ANNUNCIATOR

This annunciator is required to indicate to the janitor which line called. Furnished in oak as standard, but other finishes can be furnished on order at slight increase in price.

INTER-PHONE OUTFITS

Selecting the proper combination of Inter-phones and the necessary material to install and connect them requires a more or less complete study of the subject. In order to save our customers this expenditure of time we have arranged to furnish in standard packages, complete Inter-phone systems of small capacities, thus assuring our customers of receiving all and at the same time the proper kind and amount of material (including complete instructions) to install an Inter-phone system without difficulty. Batteries are not included in the outfits and must be ordered separately. For average conditions, four or five dry cells will be sufficient.

These outfits are primarily intended to provide a means of communication between any two points, such as, office and shop, sales-room and shipping department, executive's office and file clerk, or in the home between bedroom and kitchen, house and garage, etc. Outfits can be furnished in the following combinations:

Outfit No. 14-A

Outfit No. 14-B

Outfit No. 15-A

Outfit No. 15-B

Nos. 14 and 15 Outfits

The Nos. 14 and 15 Outfits are intended to provide communication between two points only. The No. 14 outfit contains wall sets—the No. 15 outfit contains hand sets.

Outfit No.	Description	List Price
14	Includes one No. 1327-S and one No. 1327-T wall Inter-phone, but no installing and wiring material.	\$14.30
15	Includes one No. 6043-A and one No. 6043-B hand Inter-phone, but no installing and wiring material.	17.50
14-A	For use where the wire is to be run entirely under cover—not exposed to moisture or weather. Contents: One No. 14 Outfit as above described, 75 feet insulated, 3-conductor Copper Wire, 2 Battery Connectors, Insulated Nails for fastening wire, and illustrated installing instruction	16.40
15-A	Includes a No. 15 Outfit together with installing and wiring material as described under Outfit No. 14-A.	19.60
14-B	For use where the wire is to be run in the open, between or outside of buildings and thus exposed to weather and moisture. Contents: One No. 14 Outfit as above described, 150 feet outside, 3-conductor Copper Wire, 2 Brackets with screws, hooks and knobs to attach wire to buildings, 2 Porcelain Tubes to insulate wires when entering building, 2 Battery Connectors, 25 Insulated Nails for fastening wire inside building, and illustrated installing instruction.	20.60
15-B	Includes a No. 15 Outfit together with installing and wiring materials as described under Outfit No. 14-A.	23.80

Complete Connection Diagram furnished with each Inter-phone

INTER-PHONE OUTFITS (Continued)

No. 16 Outfits

The No. 16 Outfit is intended to be used for transforming any existing call bell, buzzer or annunciator circuit, consisting of one bell, buzzer or annunciator and one or more push buttons, into a practical working telephone line. This can be done by using the existing wires, bell and batteries, replacing the push button with a hand Inter-phone and connecting the other hand Inter-phone to the wire near the bell.

Outfit No.	Description	List Price
16-A	To be used with any existing circuit, consisting of one bell or buzzer and one push button only. Contents: Two No. 1003-K Hand Inter-phones, 2 Connecting Blocks with mounting screws, 25 feet Insulated, twisted pair Copper Wire, 20 Insulated Nails for fastening wire, 2 Hooks for holding hand sets, and illustrated installing instruction	\$11.60
16-B	To be used in addition to No. 16-A Outfit if existing bell, buzzer or annunciator system has two or more push buttons. In such cases, the requirements would be: One (only) No. 16-A Outfit, containing two hand sets—one for bell, buzzer or annunciator station, the other to replace one of the push buttons and one (or more) No. 16-B Outfits. One required for each additional push button in the system that are to be changed over to Inter-phone stations. Contents of No. 16-B Outfit: One No. 1003-K Hand Inter-phone, 1 Connecting Block with mounting screws, 12 feet Insulated, twisted pair Copper Wire, 10 Insulated Nails for fastening wire, 1 Hook for holding hand set, and illustrated installing instruction	6.00

Outfit No. 17

No. 17 Outfits

The No. 17 Outfit is a simple equipment for providing intercommunication between two points separated by a distance not exceeding 80 feet, where the wire can be installed wholly indoors or thoroughly protected from moisture and weather.

Outfit No.	Description	List Price
17	Contents: 2 Hand Inter-phones, 2 Connecting Blocks with mounting screws, 80 feet Insulated, twisted pair Copper Wire, 60 Insulated Nails for fastening wire, 2 Hooks for holding hand sets, 2 Bells with 2½-inch gongs, 2 Battery Connectors, and illustrated installing instruction	\$15.30

Complete Connection Diagram furnished with each Inter-phone

MECHANICAL SIGNALING SYSTEMS

General

No. 1-A. Signaling Set

APPLICATION. In every mercantile establishment it is often necessary to communicate immediately with the manager, superintendent or other executive who is not at his desk or within hearing range of his telephone bell at the moment.

In schools the principal, his assistant or the janitor are frequently wanted when they may be in any one of several places about the building.

The same is true of hotels and Y. M. C. A. buildings where the presence of the janitor, engineer or manager may be urgently needed at the office.

In hospitals the house doctor or head nurse may be wanted in a hurry when they are on their rounds.

In prisons or asylums the superintendent, warden, head keeper, or other official is apt to be suddenly wanted on an important matter.

To call different telephones (if such equipment is part of the building) one at a time, or to send a messenger in order to locate the desired person, frequently takes a considerable period of time, but with a mechanical code signaling system installed, the operator, clerk or other employee in the office or other central point gives a turn to a revolving key marked with the name of the individual wanted, which instantly signals the person desired wherever he may be.

DESCRIPTION. The equipment consists of a centrally located wooden cabinet equipped with revolving contact keys. A number of bells are mounted in different parts of the building which, when actuated from the central key cabinet, will ring simultaneously.

OPERATION. The key cabinet is equipped with a number of revolving keys. When the handle of a key is turned one-half revolution it slowly moves back to its original position, making and breaking an electrical contact a number of times at different intervals, thus forming a combination which is repeated four times before the key comes to a final stop. Each key produces a combination different from any of the other keys.

By placing the bells in such locations that, no matter where a person may be, he will always be within hearing distance of one of them, and by installing at a central point a key cabinet equipped with as many keys as there are persons in the organization who are apt to be frequently wanted on important matters, a call can be sent out for any one of them just by turning the key assigned to him. All bells will immediately sound the proper combination, and on hearing his call the person wanted steps to the nearest telephone and is in communication with the office immediately.

CAPACITY. The system can be furnished with keys for sending out 4, 6, 8, 10, 12, 14 and 16 different signals, thus producing maximum calling facilities for sixteen persons, which is usually all that average conditions require. A special signal used for fires, etc., can also be included in any of the above mentioned number of signals.

BELLS. It has been found that single stroke bells with 6-inch gongs will give satisfactory service under ordinary conditions. Any number and various sizes of bells can be combined to form one system.

INSTALLATION. The signaling system can be used alone or in connection with an Inter-phone System.

1. **Independently.** The signaling system can be installed and operated entirely separate and apart from any other system, and requires only two wires for its operation. As many bells as desired can be connected and made to simultaneously sound any desired code by turning the proper key in the key cabinet.

2. **With Intercommunicating Telephone Systems.** These signal sets can be connected directly to our Inter-phones without any change in the wiring of the instruments, or special bells. In this case, the bells on the instruments sound the code signals simultaneously whenever any one of the calling keys in the key cabinet is set in motion.

In case, however, loud ringing bells are required, or bells in locations where telephones are not installed, it will be found more satisfactory to install this code signaling system independently of any other equipment.

3. **With Private Exchange or Private Branch Exchange Telephone Systems.** A mechanical signaling system, when installed in connection with telephone systems of this class, should be put in as a separate system without special regard for the location of the various telephone instruments, the object being rather to so locate the bells that they will be best heard from every nook and corner of the plant.

MECHANICAL SIGNALING SYSTEMS (Continued)

CONNECTION DIAGRAMS. No connection diagrams are given for the reason that there are many different signaling systems in which the code signaling sets can be used. We furnish, upon application, detail information covering the connection of these sets with Inter-phones and with large and small bells and buzzers. If your requirements are stated, we will be very glad to work up a suitable signaling system and make you a quotation.

REQUIREMENTS. The following apparatus and accessories are usually required.

The key cabinet (state capacity) with 4 (or less) up to 16 keys.

Any number and size of bells.

One resistance coil and condenser box (to prevent sparking at contacts).

One or more relay boxes, depending upon the number and size of bells and the length and size of wire.

Necessary wire to connect the apparatus.

One or more batteries consisting of four or more cells, depending upon the number and size of bells and the length and size of wire.

Telephone Equipment

Code Signaling Sets

The cabinets are made of golden oak, quarter-sawn. The metal face is finished in dull black with nickel trimmings. The sets are made only in 4 and 6 key sizes (each key providing a different signal), but they can be mounted side by side when 8, 10, 12, 14 or 16 signals are required.

Code No.	No. of Signals	Description	List Price Each
1-A	4	Used for 4 signals.....	\$77.60
1-B	4	Used with 1A for 8 signals.....	77.60
1-C	4	Used with 2A for 10 signals.....	77.60
1-E	4	Used with 1A and 1B for 12 signals...	77.60
1-F	4	Used with 2A and 1C for 14 signals...	77.60
1-D	4	Used with 1A, 1B and 1E for 16 signals.....	77.60
2-A	6	Used for 6 signals.....	100.10
2-B	6	Used with 1A for 10 signals.....	100.10
2-C	6	Used with 2A for 12 signals.....	100.10
2-E	6	Used with 1A and 1B for 14 signals..	100.10
2-D	6	Used with 2A and 1C for 16 signals..	100.10

Each of the above key cabinets may be ordered partially equipped. Deduct for each key omitted, list \$5.45.

Bells

Single stroke, enclosed type, Faraday Model "ASS."

List No.	Description
361111.....	4-inch gong
361113.....	6-inch gong
361114.....	8-inch gong

Prices on request.

Coil, Condenser and Relay Boxes

With each code signaling set a resistance coil and condenser box, No. 262F, is required to prevent excessive sparking at the contacts. This box is made of quarter-sawn oak to match the set.

A relay box is necessary under certain conditions, depending upon the number and size of bells and the length and size of wire. This box contains a resistance coil and a condenser in addition to the relay. It is similar in appearance to the No. 262F, and is known as the No. 262G Relay Box.

Code No.	Description	List Price Each
262-F	Coil and Condenser Box. Used to prevent sparking at contacts.....	\$6.30
262-G	Relay Box.....	11.30

INTER-PHONE ACCESSORIES

Cable

Cable for Interior
Use

Cable for Outside
Use

Three general types of cable are provided. Each type has its particular use, and care should be taken to order the proper cable for any desired purpose. These types are as follows:

1. Interior cable with outside braiding treated with gray fire-proof paint. Use only in dry places.
2. Interior cable with green glazed cotton outside braiding. Use only in dry places where exposed to view.
3. Outside cable, lead covered. Always use this cable outside, and inside in every case where there is apt to be moisture even in a small degree.

Lead-covered cables are not listed with separate code numbers. Any fire-proofed type of cable may be ordered with a lead sheath.

All cables are provided with a standard color scheme, so that each conductor can be distinguished from any other. The pairs are properly twisted to prevent inductive disturbances.

SWITCHBOARDS

Private Exchange and P. B. X. Switchboards

Primarily intended to provide communication between various points in one or several buildings, but in addition may be secured without or with provision for connection to a general public telephone exchange (either magneto or central battery).

No. 1801 SWITCHBOARD

This equipment meets the demand for a thoroughly reliable yet inexpensive telephone switchboard. All the apparatus necessary for the operation of the board is contained within the framework. The units fit together like a sectional bookcase. It is possible to make a switchboard of any capacity from 20 up to 100 lines by simply adding units. This type of switchboard is usually operated by the office boy, stenographer or clerk. The equipment can be arranged for connection with a general public telephone system, either magneto or central battery. This board is suitable for apartment houses, hospitals, schools, manufacturing establishments, prisons and asylums, in fact, anywhere where intercommunication is desired.

No. 1801 Switchboard, Showing Flexibility of Unit System and Ease with which Different Units can be Assembled to Meet a Variety of Operating Conditions.

SYSTEMS

To meet the different classes of service required of a switchboard of this type, four different arrangements are provided and classed respectively as systems "A," "B," "C," and "D."

System A. Provides for intercommunication between switchboard and station only. No intercommunication between any two stations through board. No connection with outside telephone exchange.

System B. Provides for intercommunication between switchboard and stations and intercommunication between stations through board. No connection with outside exchange.

System C. Provides for intercommunication between switchboards and stations and intercommunication between stations through board and connections to outside telephone exchange (magneto or central battery).

Note: Telephone sets used with the above systems are equipped with direct current bells. The wiring consists of two individual and one common conductor from switchboard to each station.

System D. Is the same as **System C** except the telephones used are equipped with alternating current bells. The wiring consists of two individual conductors from switchboard to each station.

PRIVATE EXCHANGE AND P. B. X. SWITCHBOARDS

No. 1801 Switchboard

No. 1801 Switchboard System "A." Equipped With

- 1—Top Unit
- 1—Simultaneous Ringing, Listening and Talking Unit
- 1—Line Unit
- 1—Cord Unit
- 1—Supporting Unit

LIST OF UNITS

A complete No. 1801 switchboard consists of at least three or more units or sections, as follows:

(A) One supporting unit. (B) One cord unit. NOTE: The cord unit always contains 20 line circuits. (C) One top unit, and as many line units as are necessary to increase capacity of switchboard from 20 to the desired number of lines.

The following table lists standard units. These units are carried in stock packed in individual boxes. It is necessary, to avoid expense and delay, that standard units be ordered exactly as listed.

Care should be taken to select units which are designed to be used together.

The following tables give information as to the proper units to order for any class of service:

No. 1801 Switchboard System "B"

SUPPORTING UNITS

All Systems		Description
Code No.	Used with Cord Units	
K-1	JA-1 and JB-1.	Consists of two spanned brackets for supporting the switchboard on the wall.
K-2	JA-2, JB-2, JA-3, JB-3, JA-4, JB-4, JA-5, JB-5, JA-6, JB-6, JA-7, JB-7.	Consists of a shelf supported by two brackets, and a casing to cover the cords, adapted to support the switchboard on the wall.
K-3	JA-2, JB-2, JA-3, JB-3, JA-4, JB-4, JA-5, JB-5, JA-6, JB-6, JA-7, JB-7.	Consists of a flat top desk with a hole cut in the top into which the base of the cord units is placed. The desk serves as a casing for the cords, and also contains one tier of drawers.

CORD UNITS

System "A"

Code No.	Used with	Apparatus or Circuits Incl.	Remarks
JA-1	All line units and G-1 top unit.	1 operator's hand set, 1 operator's cord, 1 night alarm circuit, 20 regular line circuits (5 wired for long line service).*	Provides for communication between the operator and the stations only; no intercommunication between stations is possible.
JB-1	All line units and HA-7 simultaneous ringing and talking units.	Same as JA-1 except equipped with desk stand instead of hand set.	

*If service for a number of long lines (up to 5) is required, use HA-2 line unit.

PRIVATE EXCHANGE AND P. B. X. SWITCHBOARDS

NO. 1801 Switchboard

Cord Units (Continued)

SYSTEM "B"

Code No.	Used with	Apparatus or Circuits Incl.	Remarks	
JA-2	All line units and HA-7 simultaneous ringing and talking units.	G-1 top unit.	1 operator's hand set, 5 operator's connecting cords with ringing and listening keys, 1 night alarm circuit, 20 regular lines (5 wired for long line service).*	Provides for communication between the operator and stations, and facilities for five simultaneous communications between different stations.
JB-2	All line units and HA-7 simultaneous ringing and talking units.	G-2 top unit.	Same as JA-2 except equipped with desk stand instead of hand set.	Provides for communication between the operator and the stations, and facilities for five simultaneous connections between different stations.

SYSTEM "C"

JA-3	All line units and HA-7 simultaneous ringing and talking units.	G-1 top unit.	1 operator's hand set, 5 operator's connecting cord circuits, 2 plug-ended trunks to central battery telephone exchange, 1 night alarm circuit, 20 regular line circuits (5 wired for long line service).*	Provides for communication between the operator and the stations, facilities for five simultaneous connections between different stations, and two trunk connections to a central battery telephone exchange.
JB-3	All line units and HA-7 simultaneous ringing and talking units.	G-2 top unit.	Same as JA-3 except equipped with desk stand instead of hand set.	Provides for communication between the operator and the stations, facilities for five simultaneous connections between different stations, and two trunk connections to a central battery telephone exchange.
JA-5	All line units and HA-7 simultaneous ringing and talking units.	G-1 top unit.	1 operator's hand set, 5 operator's connecting cord circuits, 2 plug-ended trunks to magneto telephone exchange, 1 night alarm circuit, 20 regular line circuits (5 wired for long line service).*	Provides for communication between the operator and the stations, facilities for five simultaneous connections between different stations, and two trunk connections to a magneto telephone exchange.
JB-5	All line units and HA-7 simultaneous ringing and talking units.	G-2 top unit.	Same as JA-5 except equipped with desk stand instead of hand set.	Provides for communication between the operator and the stations, facilities for five simultaneous connections between different stations, and two trunk connections to a magneto telephone exchange.

SYSTEM "D"

JA-4	All line units.	G-1 top unit.	1 operator's hand set, 5 operator's connecting cord circuits, 2 plug-ended trunks to central battery telephone exchange, 1 night alarm circuit, 1 hand generator, 20 regular line circuits (5 wired for long line service).*	Provides for communication between the operator and the stations, facilities for five simultaneous connections between different stations, and two trunk connections to central battery telephone exchange.
JB-4	All line units.	G-2 top unit.	Same as JA-4 except equipped with desk stand instead of hand set.	Provides for communication between the operator and the stations, facilities for five simultaneous connections between different stations, and two trunk connections to a central battery telephone exchange.

*If service for a number of long lines (up to 5) is required, use a HA-2 line unit.
Note: HA-7 simultaneous ringing, listening and talking units cannot be used with System "D" cord units.

PRIVATE EXCHANGE AND P. B. X. SWITCHBOARDS

No. 1801 Switchboard

Cord Units (Continued)

System "D" (Continued)

Code No.	Used with	Apparatus or Circuits Incl.	Remarks
JA-6	All line units. G-1 top unit.	1 operator's hand set, 5 operator's connecting cord circuits, 2 plug-ended trunks to a magneto telephone exchange, 1 night alarm circuit, 20 regular line circuits (5 wired for long line service).*	Provides for communication between the operator and the stations, facilities for five simultaneous conversations between stations, and two trunk connections to a magneto exchange.
JB-6	All line units. G-2 top unit.	Same as JA-6 except equipped with desk set instead of hand set.	Provides for communication between the operator and the stations, facilities for five simultaneous conversations between stations, and two trunk connections to a magneto telephone exchange.

SYSTEM "D"—WITHOUT TRUNK CONNECTION

JA-7	All line units. G-1 top unit.	1 operator's hand set, 5 operator's connecting cord circuits, 1 night alarm circuit, 1 hand generator, 20 regular line circuits (5 wired for long line service).*	Provides for communication between the operator and the stations, and for five simultaneous connections between stations.
JB-7	All line units. G-2 top unit.	Same as JA-7 except equipped with desk set instead of hand set.	Provides for communication between the operator and the stations, and for five simultaneous connections between stations.

*If service for a number of long lines (up to 5) is required, use a HA-2 line units.

Line Units

HA-1	All cord units. All top units.	Wired for 20 line circuits, equipped for five, the remaining fifteen spaces blanked.	
HB-1	All cord units. All top units.	Wired for 20 line circuits, equipped for ten, the remaining ten spaces blanked.	
HC-1	All cord units. All top units.	Wired for 20 lines, equipped for 15, the remaining 5 spaces blanked.	
HD-1	All cord units. All top units.	Wired and equipped for 20 lines.	
HA-2	All cord units. All top units.	Wired and equipped with five relays only.	Provides relays for five long lines for use when there are five or less lines to be accommodated which are over 800 feet in length.

SIMULTANEOUS RINGING, TALKING AND LISTENING UNITS

HA-7	All system "A," "B" and "C" cord units.	Wired for and equipped with key for simultaneous ringing, talking and listening.	Provides facilities for ringing, talking and listening to all the stations in system simultaneously.
HA-6	All system "A," "B" and "C" cord units.	Equipped with key for answering all local calls at any designated station.	

Top Units

G-1	JA-1, JA-2, JA-3, JA-4, JA-5, JA-6, and JA-7 cord units also HA-6 and HA-7 units.	All line units.	1 hook for hand set.
G-2	JB-1, JB-2, JB-3, JB-4, JB-5, JB-6, and JB-7 cord units also HA-6 and HA-7 units.	All line units.	None.

PRIVATE EXCHANGE AND P. B. X. SWITCHBOARDS

Cordless P.B.X. Switchboards

These switchboards are intended to provide not only communication between various points in one or several buildings, but also where a large percentage of calls are to be connected to a general public telephone exchange (either magneto or central battery).

No. 505-B Cordless Switchboard. 7 Local Lines; 3 Trunk Lines

FOR CENTRAL BATTERY SERVICE

Switchboard No. 505B is particularly adapted for use in offices, banks, factories, stores, etc., where the maximum number of local stations does not exceed 7, and the number of trunk lines to the general public telephone exchange does not exceed 3.

It is very compact and can be mounted on an ordinary desk or table.

On account of the small space occupied, it is quite desirable for use where the operator has other duties to perform, such as stenographer, clerk, or office boy.

Connections are established by means of keys.

The operator's telephone consists of a desk stand complete with transmitter, receiver, and three-foot cord.

This switchboard is built from either quarter-sawed oak with a light finish (Code No. 102D), or birch finished to resemble mahogany (Code No. 104M). The current necessary to operate the No. 505B board can be supplied either from the general public telephone exchange over spare wires, or by means of a small local storage battery; 16 to 26 volts are necessary for satisfactory operation. When a local storage battery is installed, 11 cells will be found to give satisfactory results.

Standard central battery telephones described in this catalog can be used in connection with this switchboard.

The telephone bells are usually rung by means of a hand generator furnished with the switchboard, but provision is made so that ringing current can be furnished from the central office over cable pairs.

Code No.	No. of local lines	No. of trunk lines to central battery or magneto exchange	No. of simultaneous connections possible
505B	7	3	5

FOR MAGNETO SERVICE

A magneto cordless private branch exchange switchboard is also manufactured, equipped for ten magneto lines which can be used for either trunk or local connections, that is, the board can be used for 10 local lines, or 1 trunk and 9 local lines or 2 trunk and 8 local lines, etc.

This switchboard is similar in appearance to the No. 505B. It is designed for magneto service only and requires but six dry cells for its operation: three for the operator's telephone and three for the night alarm. Standard Magneto Telephones described in this catalog can be used with this switchboard.

IN ORDERING BE SURE TO SPECIFY

- The switchboard code number.
- Whether for central battery or magneto service.
- The finish—whether oak or birch-mahogany.
- The type of night alarm buzzer required, whether for direct or alternating current. (Specify direct current unless a constant supply of ringing current is supplied from the central office or other source.)
- Whether black or nickel finish desk stand is wanted.

NOTE: These switchboards are only furnished completely equipped; no partial equipments will be supplied.

PRIVATE EXCHANGE AND P. B. X. SWITCHBOARDS

No. 1260-1290 Private Exchange Switchboards
 No. 1262 Shown

No. 1300-1350 Private Exchange Switchboards
 No. 1301 Shown

Cabinet and Desk Types

These switchboards are of the central battery, lamp signal type, and are operated in practically the same manner as our largest telephone exchange equipment. They can be used either for "private exchange service," that is, intercommunication in a private telephone system only, or "private branch exchange service," that is, intercommunication in a private telephone system with connection to a magneto or central battery public telephone exchange.

LINE CIRCUITS

The regular line circuit consists of a lamp placed in series with the battery and line, through the inside contacts of a cutoff jack.

LENGTH OF LINES

When lines have a resistance greater than 100 ohms, which is the approximate equivalent of 3000 ft. of No. 22, or 6000 ft. No. 19 B. & S. gauge copper wire, we recommend the use of relays in connection with the line circuit, making it possible to operate lines of any length up to those having a resistance of 750 ohms, which is the limit usually calculated for central battery lines.

BATTERY

They may be operated from either a 22 or 40 volt battery.

TELEPHONES

Any of our standard central battery telephones can be used with these switchboards.

WOODWORK

The standard woodwork in which these switchboards can be furnished is quarter-sawed oak with a rich golden finish (Code No. 103D), or birch, finished to resemble mahogany (Code No. 104K).

Switchboards Nos. 1260 to 1290 are of the cabinet type, and are suited to the most severe operating conditions. They are intended for use where the operator is busy answering calls and has no time for other duties.

Nos. 1300 to 1350 are of the desk type, and have a large writing or desk surface and either one or two tiers of drawers. They are suitable for use in offices where the operator has time for certain clerical duties.

The desk types of sections are wired for 15 line relays per position, and have capacity for mounting 30 per position.

The cabinet types of sections are wired for 20 line relays per position, and have capacity for mounting 40 per position.

INFORMATION FOR ORDERING

Every order should give the following information:

- Code number of switchboard.
- Equipment:
 - Number of subscribers' lines with relays.
 - Number of subscribers' lines less relays.
 - Number of pairs of cords.
 - Number of plug-ended trunk circuits to central battery office.
 - Number of plug-ended circuits to magneto office.
 - Number of holding jacks, if required.
 - Whether trunks are to be arranged for charging a storage battery at the branch exchange.
- Kind of woodwork:

Whether quarter-sawed oak with golden oak finish (Code No. 103-D), or birch with mahogany finish (Code No. 104-K).
- If a special finish is desired, a sample should accompany order.
- Type of transmitter desired:

Switchboards are regularly furnished with the "suspended" type. The "chest" type can be furnished if desired.
- Whether the exchange will operate on 22 or 40 volts.
- If it is desired to connect the switchboard with a distributing box, the order must specify number of feet of cable required from base of switchboard.

NOTE.—No line cable is regularly furnished for the lines or trunks.

NOTICE.—In this connection we desire to announce that we are prepared to furnish complete equipment, such as building cable, braided rubber-covered copper wire, etc., for wiring branch exchange equipments in hotels, schools, etc. Advise us of your requirements, and we will send you literature and suggestions.

MAGNETO SWITCHBOARDS

Are intended to provide service in small public telephone exchanges having 10 or more up to 300 lines.

General

Western Electric Switchboards have been the recognized standard of the leading telephone companies throughout the country for the past thirty-five years and have satisfactorily met every operating condition.

All lumber used in their construction is thoroughly seasoned and kiln dried, which prevents warping and cracking. All joints are tongued and grooved and securely fastened with a superior quality of glue. All joints between the sides, front and top are reinforced with steel angles.

The exterior surface is given a very pleasing golden oak finish and the interior an ample coat of shellac to completely fill all pores.

Western Electric Switchboards are entirely free from "crosstalk," on account of the fact that all signal and drop windings are enclosed in soft Norway iron shells and all wiring done with double silk and single cotton covered wire. All keys, cords, plugs, jacks, signals, etc., are standard apparatus the same as used in the largest exchange switchboards.

No. 1012 Switchboard

No. 106 Switchboard

No. 1012 Wall Switchboard

This switchboard is entirely satisfactory for small exchanges of 10 lines or less, where the switchboard is without a regular attendant, such as when located in a store. The cord circuits are not provided with "ring-off" signals, and if accurate and rapid operating is required the use of the No. 1800 switchboard is recommended.

The light finish quarter-sawed oak cabinet is hinged in front to allow inspection of the apparatus and wiring. A five-bar hand generator is furnished. The ringers are of 1000 ohms resistance, unless otherwise ordered, and are equipped with indicators to show which line is calling. The operator answers, listens in, and rings with a cord provided for that purpose. Connections are made by the other cords without the use of keys.

Capacity	
Line circuits	10
Cord circuits	4
Dimensions of cabinet: Height, 2 feet 5½ inches; width, 1 foot 3½ inches; depth, 6¾ inches.	
Code No.	List Price
1012 Ten subscribers' lines, 4 cord circuit.	\$89.50

No. 106 Wall Switchboard

The cabinet is made of black walnut and the front is hinged to allow of easy access to the apparatus. The cabinet has a capacity of 10 subscriber lines, 1 toll line, and 4 cord circuits with supervisory drops. A five-bar hand generator, night alarm circuit is furnished. The drops are 500 ohms resistance and are bridged across the line. The operator answers, listens in, and rings with either of two duplicate cords provided for that purpose; connections are made by the other cords without the use of keys.

Equipment	
Code No.	List Price
106B Ten subscriber lines equipped with No. 19 drops, one toll line, and four cord circuits.	\$107.40
Telephone Equipment	

MAGNETO SWITCHBOARDS

No. 1800 Sectional Unit Type

Front View of 20-line wall type No. 1800 switchboard equipped with jacks and signals

This is the equipment for the small, rapidly growing telephone exchange having a maximum capacity of 50 lines. The sections are built up like a sectional bookcase. You buy just as much equipment as your present needs require, and by adding sections the switchboard grows with your business. Every kind of service that is met with in small exchanges can be provided for in these switchboards by apparatus most suited to that service. Their flexibility of operation and their ease of increase in size make them especially adaptable for the small exchange.

Some of the good features of this type of switchboard are:

1. The ease with which a switchboard can be assembled to meet any line or operating condition.
2. You buy at one time only as much switchboard capacity as you need.
3. The switchboard capacity can be increased as your business grows, thus requiring a minimum expenditure of capital at all times.
4. All the operating features of a large Western Electric switchboard have been retained in this Sectional Unit board, from the standpoints of both circuit and mechanical arrangement.
5. Standard Western Electric quality apparatus and material is used throughout.
6. The accessibility to all terminals and apparatus.
7. The strength and rugged construction of the parts subject to wear and rough usage, and the fine appearance of the complete assembled switchboard.

A complete No. 1800 switchboard consists of at least four or more units or sections, as follows:

- (a) One supporting unit.
- (b) One cord unit.
- (c) One line unit (capacity 10 lines).
- (d) One top unit, and

As many line units as are necessary to increase the capacity from 10 to the desired number of lines (not exceeding 50.)

Write us advising your requirements, and our engineers will prepare a specification covering a switchboard adapted to your needs, and tell you how much it will cost. All without obligation on your part to purchase.

MAGNETO SWITCHBOARDS

No. 1200 Type With Self-restored Line Signals

The No. 1200 type Switchboards are designed for the medium-sized magneto exchange. The smallest board—the No. 1200—has an ultimate capacity of 60 lines, and the largest—the No. 1250—a capacity of 300 lines. Additional capacity can be secured by lining up two or more of these switchboard sections. However, magneto equipment is not recommended for exchanges of more than 330 lines.

For larger installations, and often for those much smaller, Central Battery equipment is recommended. If, owing to local conditions, it is impossible to install Central Battery equipment, our No. 1013 type of Magneto Multiple Switchboard is the proper equipment. Detailed information furnished upon request.

All lumber used in the construction of these switchboard cabinets is thoroughly seasoned and kiln dried which prevents any warping or cracking. All joints in the woodwork are tongued and grooved, and are securely fastened with a fine quality of glue, no butt joints being used. All joints between the sides, front and roof are reinforced with steel angles.

The apparatus in the face of the switchboard is supported by a rigid steel framework, which is fastened by heavy wood screws to the front, sides and top of the switchboard section. The apparatus is fastened to this steel framework by machine screws, insuring permanent alignment.

The key-shelf is strengthened by steel bars to which the operator's keys are fastened by means of machine screws.

The plug-shelf is covered with $\frac{1}{8}$ -inch selected sole leather to afford protection against the impact of the falling plugs when the operator pulls down a connection.

All of these switchboard sections are fitted with removable rear doors which are of the same wood as the remainder of the section.

Polished brass foot-rails are provided on all of these switchboards.

The exterior surface of all cabinets is given a rich, deep golden-oak finish.

(Code No. 103C.) This finish presents a very pleasing appearance. The outer coat of varnish is hand-rubbed and of such character as to not scratch easily or show ordinary wear. The interior surface of all cabinets is given a shellac finish which fills the pores of the wood and effectually prevents warping or decay.

Central Office Switchboard
 No. 1220. Capacity 195 Lines.
 15 Pairs of Cords

MAGNETO TELEPHONES

These telephones are used in conjunction with the Nos. 1012 and 106 Wall Switchboards, the No. 1800 Sectional Unit Switchboard and the No. 1200 Type Switchboards, as described on the foregoing pages or with any other standard magneto telephone system. The following are a few of our representative types.

No. 1317 Type Telephone

DEFINITIONS OF TERMS

The following definitions of terms used in connection with our telephone sets later described may be helpful.

Bridging. When two or more telephone instruments have each one line terminal or binding post connected to one wire or conductor of the line, and the other terminal or binding post connected to the remaining line wire or ground (in the case of a grounded or common return circuit), they are said to be bridged across the line and are called bridging telephones.

Series. When two or more telephone instruments are so connected to a line that the current, both ringing and talking, flowing in the circuit, must pass through each instrument in succession, they are said to be connected in series, and are called series telephones.

Series telephone systems are seldom used in present day service and their use is not recommended. The use of bridging equipment is recommended as being much more satisfactory.

Code Ringing. When two or more telephones are connected to a line (either series or bridging) it is necessary to use a different ring for each, such as two short, three short, one long and a short, two long and two short or other combinations, so that each party will know when he is wanted and will not have to answer the telephone each time the bell rings. Such a set of prearranged signals or rings is called a code and telephones for this service are known as Code Ringing Sets.

Four-party Selective Ringing Using Pulsating Current. Four telephones arranged for this service can be connected to a metallic (two wire) circuit and the bell of any one of the four rung at the will of the switchboard operator without ringing the others on the line, provided the switchboard is equipped with a generator or other ringing machine delivering pulsating current, such as our No. 48B Hand Generator or No. 84E Interrupter.

Telephones arranged for this service can only signal the central office and cannot call each other without the assistance of the operator.

Selective Central Office Signaling. Bridging telephones arranged for this service and equipped with a push button, connected to a metallic (two wire) circuit can call each other without signaling the central office, or, by pushing the button while turning the generator crank, signal the central office without ringing the bells of the other telephones on the line.

This is accomplished by bridging the telephones across the line and wiring them so that the generators are normally connected to the two wires of the line, but when the push button is operated they are connected between one side of the line and ground. The switchboard drop is also permanently connected between the line and ground and of course is only operated when the generator is turned while the button is pushed.

Light Loaded Lines. A light loaded line is one less than ten miles long and equipped with not more than ten telephones.

Moderate Loaded Lines. A medium loaded line is one ten to thirty miles in length and equipped with from ten to thirty telephones.

Heavy Loaded Lines. A heavy loaded line is one thirty to fifty miles long and equipped with from thirty to sixty telephones.

CONDENSERS

On rural lines, trouble sometimes occurs due to parties "listening in" whenever their bells ring, regardless of whether the call is for them or not. Whenever this is done, it is usually impossible to ring on the line after the receiver is off the hook. To overcome this feature it is customary to furnish telephones equipped with a condenser wired in the receiver circuit.

The Nos. 1317 R. & S. and 1305 S. & T. Wall Telephones and the corresponding desk telephones are so equipped, and all other Nos. 1317 and 1305 Telephones have terminals provided so that a condenser can be connected at any time. Screw mounting holes are provided so that no drilling is necessary.

MAGNETO TELEPHONES

No. 1317 Type Telephone

No. 1317 N or P, Open
No. 1317 Type

The No. 1317 wall type telephone listed below is the most extensively used and satisfactory magneto telephone on the market to-day.

They are all equipped with one No. 350W transmitter, one No. 143AW receiver, one No. 13 induction coil, one 2½ foot No. 419 receiver cord and two No. 338 battery cords.

All sets are wired for a 2 M. F. No. 21W condenser, to be inserted in receiver circuit. If condenser is desired it should be so stated on the order, excepting the Nos. 1317R and 1317S sets, which are already equipped with condenser. The telephones operated by harmonic current are equipped with a 1 M. F. No. 21F condenser.

Two Blue Bell Batteries and a No. 60A protector are furnished with each telephone and are included in the price.

Instructions for installing will be furnished on request.

--------	----------------------	------------------	-------	--------------------------------------	---------

MAGNETO TELEPHONES

No. 1305

No. 1305—Open

No. 1305 Type

The No. 1305 type telephone is intended for use in places where it is desirable to use a telephone smaller than the No. 1317 type. This set is not equipped with a writing shelf, nor is any provision made for installing the batteries in the telephone. The batteries are supposed to be mounted in some out-of-the-way place, either in a little battery box or on a shelf.

Batteries and protector are not included in the following prices and are not furnished unless specified in order.

DESIGN AND CONSTRUCTION

The cabinet and apparatus of this set are of the same high standard of material and workmanship as is used in the No. 1317 type telephone.

The standard of transmission and the ringing efficiency of these two sets are the same.

The following telephones are all equipped with one No. 329W transmitter, one No. 3A transmitter bracket, one No. 143AW receiver, one No. 13 induction coil, one 2½ foot No. 419 receiver cord, and one 5½ inch No. 179 transmitter cord.

The gongs on these sets have a black enamel finish.

A wiring diagram is pasted in every set.

Instructions for installing will be furnished on request.

Telephone Equipment

MAGNETO TELEPHONES

Desk Type Magneto Telephones

The desk telephone and the telephone with extension arms are being used more and more every day. This is due to their convenience and neat appearance, and also to the improvements in design and manufacture, which have resulted in making an instrument that is practically as free from trouble as a wall set.

DESIGN AND CONSTRUCTION

The desk stands are carefully designed and constructed of the best materials obtainable. The working parts are held firmly within the upright tube or handle and by taking out only one screw can be removed as a unit for the purpose of connecting or disconnecting the cords or for inspection.

The finish of our desk stands is a special dull black japan. Nickel plated finish will be furnished if specified at an additional cost of 25 cents.

The following telephones are all equipped with one No. 329W transmitter and one No. 143AW receiver.

A wiring diagram is pasted in every set.

Instructions for installing will be furnished on request.

The gongs on the desk set boxes have a black enamel finish.

Batteries and protector are not included in the following prices and are not furnished unless specified in order.

MINE TELEPHONE APPARATUS

The severe conditions encountered underground make it necessary to provide unusually well protected telephone apparatus for use in mines. For use above ground, in conjunction with the mine telephones, standard telephone instruments can be used unless it is proposed to place them in exposed locations. In that event metal telephones should be used.

Mine Telephones

The following descriptions cover the Western Electric Mine Telephone and regular telephones generally used above ground. Mine telephone systems usually consist of several instruments connected across one pair of wires forming a party line. Local battery magneto telephones are used and signaling done by code ringing. When there are more lines than one, they are usually terminated in a switchboard located at some central point, such as the superintendent's office.

For further information on mine telephone equipment write for hand book entitled "Mine Telephone Systems and How to Install Them," which covers the entire mine telephone field.

No. 1317 Type Telephone

No. 6004B-Desk Telephone
Telephone Equipment

Metal Telephones

Code No.	Description	List Price
1336A	Iron box telephone for heavy load service. Not equipped with ringer. Contains 5 bar A. C. generator, switch hook, induction coil, transmitter and receiver.	\$51.00
1336E	Iron box telephone for heavy load service. Equipped with 2500 ohm ringer, 5 bar A. C. generator, switch hook, induction coil, transmitter and receiver.	54.00

Wooden Wall Telephones

1317P	For use in buildings above ground. Contains a 2500 ohm unbiased ringer, 5 bar A. C. generator, induction coil, switch hook, transmitter, receiver and cords. Two Blue Bell batteries and a No. 60A protector are furnished with each telephone and are included in the price.	\$23.00
1317S	Same as No. 1317P, but with condenser in series with receiver.	23.90

Desk Telephones

6004B	For use in buildings above ground. The telephone includes 1 No. 300K desk set box, containing a 2500 ohm unbiased ringer, 5 bar A. C. generator and induction coil; 1 No. 1020PC desk stand, comprising stand, receiver, transmitter and cords.	\$25.60
-------	---	---------

BATTERY REQUIREMENTS

Two "Blue Bell" dry batteries are necessary for the satisfactory operation of any of the above telephones.

Batteries are not regularly furnished, however (except in the case of No. 1317 sets), unless so specified on order. Batteries for use in metal type telephones on underground service should be ordered with special impregnated cartons which protect the cells from moisture.

NOTE: The above telephones may be equipped with a condenser wired in the receiver circuit, and will be so furnished if specified on the order. This will insure good signaling in case a number of receivers are off their hooks.

MINE RESCUE EQUIPMENT

Mine Rescue Crew Using Rescue Telephone Apparatus

In cases of explosions, cave-ins, etc., in mines or underground work, it is found necessary, and urgently recommended by the U. S. Bureau of Mines, to establish a means of communication between the rescue party and the surface or base of supplies.

To take care of the increasing demand for communication between the rescue party down in the mine and the men on the surface, who are directing the rescue work, the Western Electric Company has designed a flexible and reliable equipment to fulfill the requirements of this service.

A high grade of transmission on a line up to 3,300 feet can be established between the rescue party and the surface. From one to five rescue men can be in the circuit at the same time and constantly communicate between themselves and the surface.

Cable Reel Box

**Battery and Apparatus Box, Showing Apparatus
Prices on application.**

A special throat transmitter is used by the rescue party, causing no interference when standard oxygen helmets are used.

The apparatus is light, portable, strong and well-designed to meet the severe requirements of the service which it is to perform.

For detailed or additional information, write our nearest house.

RAILWAY TELEPHONE APPARATUS

Train Dispatcher's Equipment Showing No. 50 Type Selector Key Case

Railway Telephone Train Dispatching Equipment

We have not attempted to list here detailed information with regard to railway telephone train dispatching material, but only wish to call attention to the fact that we are prepared to furnish complete equipment especially adapted to your own local needs.

**No. 1330F Portable Set
Telephone Equipment**

At each distributing house a railway telephone engineer is located, who will cheerfully render any assistance desired by our customers. As all installations are so highly special, in practically every case particular equipment is necessary to take care of the local service conditions. To secure the best results, it is necessary to have special telephones for use on lines exposed to high tension wires and special portable telephone sets for emergency use.

Detailed information and prices on request.

Western Electric TELEPHONE BOOTHS

Folding Door Telephone Booths

The telephone booths shown are our standard types furnished in oak. We carry these in stock and are prepared to ship them promptly; also booths made of other woods than oak and booths of special finish and size. These special booths, however, are considerably more expensive than the standard booths which we carry in stock.

The booths are constructed from carefully selected, thoroughly seasoned, kiln-dried timber, and are perfect in design, material and workmanship.

The booths are shipped "knock down" and can be readily set up.

A shelf is furnished as standard equipment for each booth.

The standard booths have the door hinged on the right-hand side facing the booth.

These booths are compact enough to be used in narrow passageways—they are equipped with glass panels and door and are a serviceable telephone booth for business offices, banks, factories, stores, clubs, hotels and restaurants.

The folding door features are that the door operates both ways by pulling the handle, it remains in any position, and stays closed without use of catches. There are no tracks in the floor to gather dirt and become clogged. The ventilation is perfect. The door when operated extends only four inches beyond the face of booth.

Construction: Outside finished on front, sides and back.

Telephone Booths

TELEPHONE AND TELEGRAPH CABLE

Cable

Lead-covered Cable

The use of lead-covered cable provides a convenient method for doing away with cumbersome and unsightly open-wire construction for telephone and telegraph lines and also makes it possible to place wires underground. In the first case, the lead-covered cable protects the wires from sleet and wind storms, as the wires will not suffer injury even though poles may be blown down; its use cuts down maintenance expense as it is not subject to the troubles that are inherent in open-wire construction, and, furthermore, it is inconspicuous and inexpensive. In the second case, the wires are fully protected from the corrosion that would take place with any other form of inexpensive insulation or covering.

Lead-covered cable in its simplest and most usual form takes for its manufacture four different raw materials—copper for the wire, paper for the insulation, and pure lead or an alloy of lead and antimony for the sheath. These raw materials are all subjected to thorough inspection before they are made a part of Western Electric lead-covered cable, so that all such materials which find their way to stock will be up to specification standards, and the first step taken to insure a high quality standard.

The methods used in the manufacture of the cable are the result of careful study and experience dating back to the early days of cable making. Enormous quantities of lead-covered cable are manufactured at the Hawthorne (Illinois) plant of the Western Electric Company in all sizes from a two-pair to a 600 pair No. 22 B. & S. Gauge Cable. No. 19 B. & S. Gauge Cable is made in sizes up to 300 pairs. Besides the lead-covered cable there is also a large amount of submarine cable manufactured each year. This is lead-covered cable with a heavy lead sheath which is given several servings of jute roving saturated with pine tar and the whole covered with either a single or a double armoring of steel wire followed by more servings of jute and pine tar.

All cable is thoroughly tested during and after the manufacturing processes for electrical characteristics. These tests are made to determine the presence of crosses, opens and grounds, to measure the insulation resistance and electrostatic capacity and to determine the conductivity. Breakdown tests are also made.

The methods employed in the inspecting and testing of raw materials, the carefully developed design and manufacturing methods, the thorough process inspections and the final testing cannot do other than produce commercially perfect cable.

Every possible precaution is taken to keep out faults in the finished product so that the customer after installing the cable may be spared any annoyance or extra expense after the lines are ready to be cut into service.

Cable for use in aerial or underground lines must have an insulating resistance of at least 500 megohms per mile, and that for inside use, 100 megohms per mile.

The electrostatic capacity is reduced to a minimum so that transmission efficiency will be correspondingly high. Capacities, mutual and grounded, specified by the customer, are guaranteed to be those capacities and no more. Should the final tests show the capacities to be greater and the insulation resistance less than those called for in the specifications, that cable will not be shipped.

Engineers, qualified by experience to advise on all questions of cable installation, are located at each of our distributing houses. They are at the customer's service for consultation.

Prices on request.

TELEPHONE APPARATUS

Gray Coin Collectors or Pay Stations

Coin collectors are used at public pay stations or wherever it is desired to collect the toll charge on a cash basis.

No electrical connections are necessary, it only being necessary to fasten the coin collector to the telephone by means of two or three screws.

The signals are given the operator automatically when the coins are deposited in the proper slot, there being no levers to push or pull.

No. 11 Coin Collector

Condensers

Used in telephones on party lines where ringing trouble often occurs, due to parties "listening in" or leaving their receivers off the hook.

Telephones equipped with one of these condensers wired in series with the receiver overcome this difficulty, and it is possible to ring satisfactorily on a line with several receivers off provided the telephones are so equipped.

Cords

FOR TELEPHONE SETS AND SWITCHBOARDS

There is a Western Electric cord to fit any telephone set or switchboard. If none of the cords described below meet your requirements, write us, sending if possible a sample cord (an old one will do) or a sketch, paying particular attention to the kind of tip required.

Always specify length of cord when ordering.

Wall Telephone Receiver Cords

Code No.	Description	Used with	Standard Length	Cord Tip	List Price Each
10	Two conductor tinsel cord, green silk covering.	Receiver on wall set.	3 ft.	No. 29 (receiver end)

Cords (Continued)

Switchboard Cords (No plugs included)

It is customary to use 4-ft. switchboard and 6-ft. operator's telephone cords on small magneto and private exchanges, and 6-ft. switchboard and operator's telephone cords on other boards.

These lengths are carried in stock, but others will be furnished on request. The switchboard cords are regularly made in three colors, red, white, and green. The white cords are furnished unless the color is specified.

In ordering, specify the code number, length, color, and if plugs are to be attached, give the code number of the plugs. No extra charge is made for attaching plugs to cords.

Code No.	Description	Used with	Standard Length	Cord Tips	List Price Each
493	Two conductor tinsel cord. Furnished in white, red, or green covering as specified.	No. 47 plugs on switchboards	4 or 6 ft. 3 ins.	Specify No. 8 cord tips	4 ft. \$0.73 6 ft. .94
87	Four conductor tinsel cord, green silk covering.	Operator's head receiver and chest transmitter when attached to No. 103 or No. 112 plug	6 ft.	No. 38 (plug end) No. 29 (receiver end) No. 38 (transmitter end)	1.38
437	Single conductor tinsel cord, green silk covering.	Swinging type switchboard transmitter	6 ft.	No. 29 (trans. end) No. 62 (swbd. end)	.18
30	Two conductor tinsel cord, green silk covering.	Switchboard head receiver when attached to No. 85 plug	4½ or 6 ft.	No. 47 (plug end) No. 29 (receiver end)	4½ ft. .54 6 ft. .645
369	Two conductor tinsel cord, green silk covering.	Switchboard head receiver when attached to No. 136 plug	4½ ft. or 6 ft. 3 in.	No. 38 (plug end) No. 29 (receiver end)	4½ ft. .54 6 ft. .645

Magneto Desk Set Boxes

FOR BRIDGING SERVICE—CODE RINGING

Can be used with No. 1020-AL Desk Stands and No. 1002-AC Hand Set

Nos. 315 and 300 Type Desk Set Box

Code No.	Description	List Price Each
315-H	For light load service. Includes 1 No. 51-AG 1000-ohm ringer, 1 No. 22-A 3-bar A.C. generator, 1 No. 13 induction coil.	\$10.20
300-L	For moderate load service. Includes 1 No. 51-FG 1600-ohm ringer, 1 No. 48-A 5-bar A.C. generator, 1 No. 13 induction coil.	15.60
300-M	For moderate load service. Differs from the No. 300-L in being equipped with a condenser. Includes 1 No. 51-FG 1600-ohm ringer, 1 No. 48-A 5-bar A.C. generator, 1 No. 21-W condenser, 1 No. 13 induction coil.	16.90
300-K	For heavy load service. Includes 1 No. 51-BG 2500-ohm ringer, 1 No. 48-A 5-bar A.C. generator, 1 No. 13 induction coil.	15.60
300-N	For heavy load service. Differs from the No. 300-K in being equipped with a condenser. Includes 1 No. 51-BG 2500-ohm ringer, 1 No. 48-A 5-bar A.C. generator, 1 No. 21-W condenser, 1 No. 13 induction coil.	16.90

FOR FOUR-PARTY SELECTIVE RINGING USING PULSATING CURRENT

Can be used with same Desk Stand and Hand Set as listed above.

315-J	Includes No. 49-BG 2500-ohm ringer, 1 No. 22-E 2-bar generator, and 1 No. 13 induction coil.	\$11.10

NO. 392 LOUD RINGING TYPE

392-A	1100-ohm loud ringing unbiased bell, having a metal base and cover and 6" galvanized gongs. Base and cover black finish, and all parts effectively treated to withstand the action of moisture and fumes. Equipped with a No. 21-D Condenser mounted in base	\$7.80
392-B	2850-ohm bell, otherwise the same as No. 392-A	8.30
392-E	1600-ohm bell, otherwise the same as No. 392-A	8.10

No. 392 Loud Ringing Extension Bell

Mica Fuses

These fuses are furnished either with copper or foil tips, in either Western Union or Postal style. The fuse is mounted on a mica base, or enclosed between two strips of mica.

When ordering, always specify ampere capacity desired and it is best to send sample of fuse wanted (an old one will do). If this is not possible, be sure and give the following information:

- Length.
- Style (whether Western Union or Postal).
- Kind of terminals or tips (copper or tin foil).
- Use (whether for exchange or telephone protection).

Mica Fuse, Western Union Style

Mica Fuse, Postal Style

Price on Application.

No. 61B

Distributing Frames

No. 1431A—20 Line Main Distributing Frame Equipped with 2 No. 1435M and 1 No. 1435J Protector Groups

A distributing frame is an iron framework intended for supporting switchboard protective apparatus and terminal strips. It is usually located near the point where the outside wires enter the exchange building and provides a satisfactory method of terminating such wires, as well as a very flexible means of cross connecting any outside line to any switchboard drop without interfering with the wiring inside the switchboard.

NO. 1431—20 LINE TYPE

This frame is especially suitable for the small rural exchange owning and operating a No. 1800 or other switchboard, equipped for from ten to forty lines, with little prospect of immediate growth.

Where more than twenty lines are to be accommodated, two of these frames can be lined up, one above the other. Cross connection facilities are provided by rings on the back of the frame.

This frame is designed for mounting against the wall. The drilling is so arranged that our standard protector groups can be used.

In ordering it will be necessary to specify the protector groups desired, consulting the following table.

Protector Groups

These groups have capacity for 20 lines and are designed for mounting on the No. 1431A Distributing Frame described above.

Code No.	Protection against	Equipped with	For terminating
1435J	Crosses with electric light or power circuits.	No. 7A fuses.	Outside lines.
1435K	None.	Terminal punchings.	Outside lines.
1435M	Lightning and sneak currents.	Carbon blocks and No. 69A heat coils.	Inside lines.

Prices on request.

Single Phase—Small Power Motors

The Western Electric Small Power Motors are especially adapted for operating all types of light machines and appliances to be met with in the household, shop or factory. They are simple of construction and can be operated and kept in perfect condition with a minimum of care and attention.

The best grades of materials are used in their construction, and a liberal amount of copper and high-grade magnetic iron is used, insuring excellent electrical characteristics. The care and attention devoted to the design and construction of these motors have resulted in producing a motor which operates at an exceptionally low cost and possesses perfect service reliability under the most severe conditions. When small starting current is necessary the clutch type motor should be used, except where violent load fluctuations are encountered, then the clutchless type of motor should be used.

Western Electric ALTERNATING CURRENT MOTORS

Type KS Standard Open Motor with Starter

Vertical Type Open Induction Motor KS-4, 2 H.P., 1800, 60 Cycle Totally-Enclosed Motor

Type KS-IS-60 Cycle—Single Phase—Squirrel Cage Type

The Western Electric Type KS single phase squirrel cage induction motor is especially adapted for driving all geared or belted machinery requiring constant speed with a moderate starting torque. This motor is equipped with a clutch type armature, the 15 h. p. 1200 r. p. m. motor having a clutch pulley, so that it does not take the load until full speed is reached. This insures a moderate starting current.

The motor frame is of the riveted type, so that the laminations are exposed, resulting in low operating temperatures. The motor can be mounted on the floor, wall or ceiling, and the bearing brackets are interchangeable.

* These prices on 10 and 15 h. p. sizes are for 220 volt starter, for 110 volt starter add \$.00 to the 220 volt prices.

† These motors must be supplied with some form of resistance reactance starting box.

† This Motor is Type IS.

The above motors are of the clutch armature type except the 15 h.p., 1200 r.p.m. size, which is furnished with clutch pulley.

Prices on back geared, totally enclosed and vertical KS and IS motors quoted on application.

† Pulley allowance given for this size is for the solid removable pulley, and not for the clutch with pulley complete.

* Delivery F. O. B. Bloomfield, Boston, Chicago, Cincinnati, Cleveland, Erie, Ft. Wayne, Lynn, Madison, Milwaukee, New York, Jersey City, Hoboken, Philadelphia, Pittsburgh, St. Louis or Schenectady. For warehouse deliveries write nearest house.

Western Electric

ALTERNATING CURRENT MOTORS

Type R1, 5 H.P., 1800 R.P.M., 60
Cycle Open MotorType R1
Vertical MotorType R1 Motor with
Belt-Tightener Attachment

Type R1—60 Cycle—Single Phase—Repulsion Type

The Western Electric Type R1 single phase repulsion motor is not only adaptable for use on single phase circuits which are primarily intended for lighting service only, but may also be operated on one phase of a two or three phase system. It is therefore universal in its application and the many improvements which are embodied in the design and construction of the Western Electric single phase motors insure most satisfactory results from their use.

This motor is especially adaptable for constant speed service requiring a heavy starting torque.

Many radical differences exist between the type R1 repulsion motor and the ordinary type of repulsion motor which starts as a repulsion motor and when full speed is reached, throws the brushes off the commutator by means of a centrifugal device. The R1 brushes are fixed in position for all speeds and loads, and the motor possesses the uniform speed characteristics of a direct current compound motor throughout its entire range of operation.

The R1 motor operates with excellent efficiency at all loads and is noted for its exceptionally high power factor, which ranges from 15 to 20 per cent. higher than other types of repulsion motors.

ALTERNATING CURRENT MOTORS

60 CYCLES

Polyphase Riveted Frame
Totally-Enclosed Motor

Polyphase Riveted Frame
Standard Open Motor

Polyphase Riveted Frame
Vertical Motor

Form KT—Three Phase and KQ—Two Phase—Squirrel Cage Type

The Western Electric Type KT and KQ motors are the standard alternating current motors for constant speed work requiring from $\frac{1}{4}$ to 15 h.p. Special attention has been given to their mechanical and electrical characteristics. They have exceptionally high overload capacity and operate at low temperature. There are no moving contacts and hence the possibility of sparking is entirely eliminated. The riveted frame type of construction exposes the laminations to the air, and allows the motor to be kept free from dust and dirt.

Form K Type T—Three Phase and Q—Two Phase—Squirrel Cage Type Form L—Three and Two Phase—Internal Resistance Type

Western Electric induction motors of more than $7\frac{1}{2}$ h.p. capacity 900 r. p. m. are of the skeleton frame construction which represents a distinct departure from the usual types. Mechanical strength is obtained by a careful distribution of material which avoids the use of unnecessary iron and provides the best of operation by exposing the stator core direct to open air.

The shaft and bearings are unusually large, and the whole design insures strong and rigid construction well adapted to the most severe service. High operating efficiency is secured by carefully maintaining the proper relation between power factor, slip, starting torque, maximum output, etc., to insure the most satisfactory results.

Form L. These motors differ from the Form K or squirrel cage type, in that they are provided with wound rotors and internal starting resistance by means of which high starting torque is secured with low starting current.

Western Electric ALTERNATING CURRENT MOTORS

**MIS 105 to MIS 109, Form A
Open Type Mill Motor**

**MI 101 to MI 109, Form B
Totally Enclosed Mill Motor**

Alternating Current Mill Type Motors 25 CYCLES—3 TO 150 H.P.

The Western Electric alternating current mill type motors have proven remarkably successful when applied to the externally severe service conditions which are met with in steel mills, crane and hoist service, etc. The best grade of materials enter into their construction and special care and attention is given to attaining the best mechanical and electrical characteristics, insuring the utmost service reliability, and ability to withstand severe strains and heavy overloads.

Ratings—The totally enclosed mill type motors (MI design) are furnished for mill service, based on sixty-minute operation in capacities ranging from 3 h.p. to 150 h.p. The open mill type motors (MIS design) are furnished for continuous service in sizes ranging from 25 h.p. to 150 h.p. The motors are wound for 220 or 440 volts, 25 cycles, three phase circuits, and will carry their full rated load with a temperature rise not to exceed 75 degrees C. on all parts.

The synchronous speed of the motors up to and including 20 h.p. is 750 r.p.m.; from 25 h.p. to 100 h.p., inclusive, 500 r.p.m., and the 150 h.p. motor operates at 375 r.p.m.

The standard motors are designated as Form A, but when furnished with axle brackets for back gear equipment are known as Form B. Back gear pinions and enclosing covers for the gears may be supplied, and solenoid brakes of exceptionally strong construction are built for these motors.

The solenoid brake is furnished with a special brake shoe of special molded asbestos compound. The coils of the brake are wound single phase and may be connected across any single, two or three phase circuit without change. They have a maximum retarding torque of not less than full load torque of the motor, and a holding torque of not less than 125% of full load torque.

Prices and data on application.

Hoist Equipment

The Western Electric hoists are of the friction drum type and are intended for general hoisting works in docks, ferries, warehouses, factories, quarries and similar places. They are of sturdy construction and can be depended upon for reliable service under the most exacting conditions.

The hoist equipment may be either single friction drum, double friction drum with the drums rotating in the opposite direction, double drum with the pinion between the drum gears and having both drums rotating in the same direction, or double drum with pinion between the drum gears and the boom swinging gear mounted in front.

The motors used with these hoists combine compact and rigid construction with high electrical efficiency. The shaft and bearings are unusually large while the electrical parts are designed to carry heavy overloads with safety.

Alternating current hoists are equipped with variable speed phase wound induction motors, operating on circuits of 220, 440 or 550 volts at 60 cycles. They are supplied in hoisting capacities ranging from 300 lbs. to 6000 lbs., with rope speeds of 100 to 200 feet per minute.

Single Drum Hoist
The controllers have a single operating handle, the speed changes being effected by means of a resistance external to the motor. This resistance is constructed for severe service and is practically indestructible.

The motors are rated from 1½ h.p. to 52 h.p. Prices and data on application.

SELF-EXCITED REVOLVING ARMATURE TYPE TAB AND QAB FORM ML $7\frac{1}{2}$, 15 AND 25 KW.

The self-excited revolving armature Form ML alternator is especially adapted for installation in isolated plants and small power plants. It is exceptionally compact and simple in construction and operation. The first cost as well as the operation and maintenance expenses are lower than if two separate units were used.

Ratings. The alternators are built in three sizes, $7\frac{1}{2}$, 15 and 25 kw., 120, 240, 480 and 600 volts, 60 cycle two phase or three phase. They may be operated as single phase alternators by employing two of the three phases. Their single phase rating is 70 per cent. of their three phase rating.

TYPES ATB AND AQB FORM PB 25 TO 200 KW.

The Form PB belt driven alternator is especially adapted for installation in small plants where low power factor is to be encountered. This condition exists on a line where power is supplied to induction motors, transformers or other inductive apparatus.

Type ATB Form PB Belt Driven Alternators
With Direct Connected Exciters
Power Apparatus

Ratings. These alternators are so designed that they operate at high efficiencies at all loads on power factors of from 80 to 100 per cent. They range in capacity of from 25 kw. to 200 kw., 60 cycles, two or three phase and voltages of 240, 480, 600, 1150 or 2300 volts.

They may be operated as single phase alternators by using two of the phases, and may then be rated at 65 per cent. of the polyphase rating. They may be furnished with or without direct connected exciter.

The Form PB alternators may be used as synchronous motors, synchronous condensers, and for this duty they are equipped with squirrel cage winding in the pole faces, which does not interfere with their use as generators.

Prices and data on application.

Western Electric

ALTERNATORS

Western Electric Engine Driven Alternator, Skeleton Frame Construction

Engine Driven Alternators

The Western Electric engine driven alternators are especially adapted for central stations and isolated plants where reliable service and economical operation are essential. They may be directly connected to a steam or gas engine and form a compact generating unit of exceptionally high operating efficiencies, requiring a minimum floor space and operating with practically no noise or vibration. They are furnished in capacities ranging from 30 K.W. to 240 K.W., in the standard engine speeds for 60 cycles, 240, 480, 600 or 2300 volts. 60 cycle generators employ the skeleton frame construction. Larger generators and 25 cycle machines are of the box frame type. Standard 25 cycle sizes are 180 K.W. and 240 K.W.

Standard alternators are wound for either 2 or 3 phase service, but may be operated single phase, the 3 phase delivering 70 per cent. of their rated 3 phase output, the 2 phase 50 per cent. of their rated 2 phase output. When 60 cycle alternators are furnished with direct connected exciters, exciters are provided without base, shaft or bearings, and are mounted outside of the engine company's pillow block on a suitable bracket or other support, the exciter rotor being pressed on an extension of the engine shaft.

Prices and data on application.

Western Electric

ALTERNATING CURRENT GENERATORS

Type ATB and AQB Water Wheel Driven Alternator with Pedestal Bearing Mounted on Sub-Base

Water Wheel Driven Alternators

37½ TO 200 KW.

The advance in the development of hydro-electric installations has been due in a large measure to the high operating characteristics which have been attained in the alternators designed especially for this class of service.

The Western Electric water wheel driven alternators combine the highest electrical operating characteristics with a most rugged mechanical construction presenting effective guarantee of uninterrupted service and perfect safety at relatively high speeds. They have proven exceptionally satisfactory during their many years of actual service, and embody in their design and construction the most improved features, resulting in a low cost of operation and a minimum cost of maintenance.

Prices and data on application.

Direct Current Type CVC Exciter

Direct Current Exciters

1¼ TO 20 KW.

All alternators of the revolving field type have their field coils excited by direct current, this current being led into the coils through slip rings usually mounted on the alternator shaft.

The Western Electric type CVC direct current generator is exceptionally well fitted for furnishing exciting current, due to its ability to operate over a wide range of voltage with no sparking. It responds quickly to changes in the field current, a feature which is most essential in the operation of alternator exciters.

Rating. The CVC exciters range in capacities from 1¼ to 20 kw., and are compounded for 120-125 volts. They also have a tap on the shunt to weaken the series field so that at 80 volts the characteristic curve will be flat instead of rising, a feature which improves parallel operation.

Prices and data on application.

Western Electric TRANSFORMERS

Type H Transformer

Transformer Without Case

View Showing Connection Block

Type H Transformers

In the Western Electric Type "H" transformer are incorporated many refinements of design that are the result of extended investigation under actual operating conditions and an exhaustive analysis of the most successful modern types.

Notable among the many excellent features are the means adopted to secure cool operation, the convenience and security of the terminal connections, the care taken to insure ease in handling and the perfected methods which attain the ultimate degree of insulation. Both core and copper losses have been reduced to a minimum, the symmetrical core structure insuring a balanced magnetic condition and maintaining uniform effective radiation of heat.

Transformers wound for more than one primary voltage are equipped with porcelain connection boards for adapting the primary to either circuit.

The secondaries of all 100 kv-a. transformers and less, except 608 volt transformers, can be changed for series multiple or 3 wire operation by changing the connections of the secondary leads outside of the transformer case.

Sizes 125 to 200 kv-a. inclusive, with secondaries of 110 to 220, 120 to 240 and 122 to 244 are arranged for 3 wire operation and for 2 wire service only on the maximum secondary voltage.

Sizes 125 to 200 kv-a. inclusive, with secondaries 220 to 440 and 244 to 488 have same arrangement of secondary leads as 100 kv-a. and below.

Notes

* Price does not include fuse boxes or hanging hooks, as transformers are not suitable for pole use.

† If desired, transformers will be equipped with two 5 per cent. reduced capacity taps in the primary without increase in price.

For two 5 per cent. taps in high or low tension winding, with full rated capacity at all taps, add 5 per cent. to list price.

On the Type A transformers 5 and 10 per cent. taps are provided in the 2200 volts winding, by means of which a 10 per cent. tap is obtained on the 1100 volt winding.

Fuses and Cutouts

For 15 ampere 6600 volt primary cutout complete with fuse holder enclosed in wooden box for outdoor use (List No. 15575), add \$7.50.

For 15 ampere 6600 volt expulsion fuse holder (List No. 139672) complete without fuse, add \$1.75. For use in List No. 155757 primary cutout.

For 75 ampere 6600 volt primary cutout complete with fuse holder enclosed in wooden box for outdoor use (List No. 106918), add \$11.00.

For fuses used with this transformer rated from 1, 2, 3, etc., to 15 amperes, price is 20 cents each.

For fuses used with this cutout rated from 5, 8, 10, 15, 20, etc., to 70 amperes, price is 30 cents each.

6600 Volt Transformers

The stock ratings of the 6600 volt transformers are as follows:

Primary 6600/6300/6000/5700 volts

Secondary: 1 to 4 kv-a. inclusive—110/220 volts

5 to 50 kv-a. inclusive—110/220/440 volts

75 to 200 kv-a. inclusive—220/440 volts

For a 2300 volt secondary increase the price of the 1 to 25 kv-a. inclusive 10 per cent., and 30 kv-a. to 100 kv-a. 5 per cent.

▲Delivery F. O. B. New York, N. Y., Chicago, Ill., Atlanta, Ga., St. Louis, Mo., New Orleans, La., and Cleveland, O. For warehouse deliveries write nearest house.

Western Electric TRANSFORMER SPECIALTIES

After a complete investigation of the various demands for small electrical capacity, at low voltage, we developed a uniform line of parts for manufacturing miniature air cooled transformers (Type M), ranging from 15 watts capacity to and including 2½ kilowatts.

The broad use of alternating current and the economy and ease with which its pressure may be varied through the medium of the Type M transformer to meet various requirements has made it preferable in all applications not inherently requiring direct current. By substituting this transformer for batteries or magneto generators no maintenance or replacement charges, due to wear, are incurred, less space is required and cleanliness and reliability are assured.

The parts developed are suitable for capacities of 15 to 2500 watts inclusive, 60 cycles, and to 1250 watts inclusive, 25 cycles, at voltages 550 and below. The construction may be for indoor or outdoor service as desired. Type M transformers are sufficiently attractive to permit of their installation in any place where good appearance is desired or necessary.

The following applications are representative of the many to which the Type M transformer may be readily adapted:

Electric welding.
Speed variation of motors.
Operation of small low voltage motors from higher voltage circuits.

Railway signals.
Two phase to three phase transformation.
Nitrogen filled lamps.

500	78678	17	22	92.7	5½ by 9½	4½	20	78684	23.00
750	146138	24	25	93.8	5½ by 9½	4½	25	146140	28.00
1000	78680	29	29	94.5	6½ by 11	4½	35	78685	33.00
1500	146139	40	33	95.3	6½ by 11½	4½	40	146141	41.00
2000	78683	55	36	95.4	7½ by 12½	5½	60	78686	49.00

The above electrical data applies to listed sign lighting transformers; data being based on 60 cycle, sine wave, 110 or 220 volts.

The above weights and prices do not include slate bases. The bases will be supplied at an additional net charge of 50 cents each.

NOTE: When placing requisition for slate base which is to be used for mounting a transformer already in service, the serial number of the transformer should be given so that the proper base may be supplied. This is necessary by reason of slight changes which have been made from time to time in the dimensions of the transformer cases. The shipping weight of the base is approximately 15 pounds.

Four c.p. 5 watt Mazda lamps having a range of volts from 10 to 12, have been found best adapted for sign lighting and the transformers have been designed to take care of this range of secondary voltages. They are rated for 60 cycle operation but will operate successfully on circuits from 60 to 140 cycles. They are designed with series multiple primary rating of 110-220 volts so that they can be operated on either 110 or 220 volt circuits. They are adapted for use on circuits from 100 to 120 volts or 200 to 240 volts, having a range of transformation at full load of 10:1 or 20:1 depending upon the connection.

Due to the fact that the transformers are designed for use on a wide range of primary voltages they will operate successfully on practically all sign lighting circuits, and lamps can be ordered to meet exact conditions.

These transformers are designed for either 2 or 3 wire service on the secondary and can be readily connected to all signs without changing their existing wiring.

AUTO TRANSFORMERS

List No.	Type	Approx. Shp. Wgt. in Lbs.	†Kv-a.	Depth	Wall Space	Height	Floor Space	List Price

79891	H	15	470	20	18½ by 18½	155.00

†Kv-a. output at 110 volts 2 wire or allowable unbalancing at 110-220 volts 3 wire.

Type M is air cooled. Type H is oil cooled. Shipping weight includes oil for the Type H units. All the above listed sizes of transformers are suitable for outdoor installation. Hanging hooks will be furnished with the Type H sizes.

The above auto transformers are designed for single phase, two phase or open delta transformation. These auto transformers are not designed to transform power three phase to three phase from 220 volts to 110 volts, nor can they be used to transform three to two phase power as special taps must be provided to obtain proper voltage ratio.

SPECIAL TRANSFORMERS

Prices and information, therefore, involving auto transformers for three-phase transformation, or for three-phase to two-phase transformation, or for special electric welding, signal, etc., operation, sent on application.

Motor with Oil Ring Bearings

Type SDA 1/50 H.P. Series Wound Motor

Type SD, 1/2 H.P., 1700 R.P.M.
Motor with Wick Oiled Bearings

Type SD and SDA Small Power Motors

The Western Electric small power direct current motors are especially adapted for operating all types of light machines and appliances to be met with in the household, shop or factory. They are simple in construction, and they can be operated and kept in perfect condition with a minimum of care and attention. The motors can be operated totally inverted or mounted on the side of machinery as well as when mounted upright, as the bearing brackets are interchangeable and can be shifted so as to keep the oil wells in the proper position.

* Pulleys for frames 254 and larger have crowned face adapted for flat belt.

† Includes starting rheostat with low-voltage release (CR 1000). If omitted \$8.00 list allowance may be made. Smaller sizes do not require rheostat.

‡ Frames 224 to 256 inclusive, have wick oil bearings and feet cast integral with end shields. Frame 264 has oil ring bearings and removable foot casting.

§ List No. does not include pulley.

** Delivery F. O. B. Factory, Ft. Wayne, Ind. For warehouse deliveries write nearest house.

Western Electric

DIRECT CURRENT MOTORS

Type RC Motor
Frame 11 and Below— $\frac{1}{2}$ to 20 H.P.

Type RC Motor
Frame 12 and Larger—20 to 75 H.P.

Type RC Motors

The new line of type RC direct current commutating pole motors embodies many important mechanical and electrical refinements which are not to be found in any other motor on the market to-day. The complete line of motors has been subjected to a continued and strenuous service test under the most severe conditions, in order to insure absolute reliability under any condition to which they may be subjected in actual service.

Construction. The frame is of medium weight cast steel equipped with strong feet and well-ribbed sides. Special attention has been given to the question of ventilation and accessibility. Motors may be equipped with perforated covers or with slide enclosing covers of the ventilated and non-ventilated type. They are readily adapted for ceiling and wall mounting, and may be equipped with belt tightener attachment. For details of construction, see Bulletin No. 22-2A.

*Series wound motors are not recommended for belted operation.

†Applicable only when overall length of shaft is not increased more than 12 inches. Extension may be at either end.

††By the addition of suitable field rheostat or controller and rheostat these maximum speeds can be obtained. This control is not included in prices. Requests for speed variation by field weakening on compound wound motors refer to the Company.

*Delivery F. O. B. Bloomfield, Boston, Chicago, Cincinnati, Cleveland, Erie, Ft. Wayne, Lynn, Madison, Milwaukee, New York, Jersey City, Hoboken, Philadelphia, Pittsburgh, St. Louis or Schenectady. For warehouse deliveries write nearest house.

**Western Electric
DIRECT CURRENT MOTORS
VARIABLE SPEED**

**Type RL Totally Enclosed Motor
Form B**

**Type RL Open Motor
Form C**

Type RL—Variable Speed Motors—115-230 and 550 Volts

The Western Electric type RL variable speed motor is especially adapted for installations requiring from $\frac{1}{2}$ to 2 h.p. capacity. The speed variation is obtained by field control, and full rated horse power may be obtained from the minimum to the maximum speed indicated. The motors may be obtained for 2 to 1, 3 to 1, or 4 to 1 speed adjustment.

Prices and data on application.

**Type RLC—Open Motor with Standard Terminal
Box for Conduit Wiring Frames 111-116**

**Type RLC—Open Motor
Frames 200-206**

Type RLC—Variable Speed Motors—230 and 550 Volts

The Western Electric type RLC motors range in capacity of from 2 to 50 h.p., and speed variations of 2 to 1, 3 to 1, and 4 to 1. They are exceptionally rugged in mechanical construction and are absolutely reliable under the most severe service conditions. In electrical design they possess the most modern improvements. They are equipped with commutating poles, which permits rapid fluctuation in loads with no sparking at the brushes, resulting in long life for the commutator. They are also equipped with ventilating fans rigidly mounted on the shaft. This insures cool operation and allows a very large overload capacity.

Prices and data on application.

CO—2000 Motor

CO—2500 Motor with Solenoid Brakes

Crane and Hoist Motors

The Western Electric crane and hoist motors range in capacity of from 1 to 200 h.p. These motors possess all the electrical and mechanical features necessary to successfully perform the exacting duties incident to general hoisting work. They are especially adapted to intermittent service. They are reversible and operate at low temperatures and with heavy overloads with absolute reliability.

Prices and data on application.

Western Electric

DIRECT CURRENT GENERATORS

Western Electric Direct Current Generator
Type LD 2 Wire

Western Electric Direct Current Generator
Type LDS 3 Wire

Type LD—2 Wire and Type LDS—3 Wire

The type LD and LDS engine type generators represent the highest development in generators designed primarily for central station and isolated plant equipments. All generators of this design are equipped with commutating poles which insure practically sparkless commutation over the entire range of operation. The general construction embodies simplicity and mechanical strength together with high efficiency and low operating temperatures.

Standard 2-wire generators may be converted into 3-wire generators by the addition of a compensator mounted on the rear end of the armature and a slip ring mounted on the commutator end.

Frame

The yoke is cast of soft steel selected for high magnetic permeability and is divided horizontally above the center line to avoid disturbance of the poles in assembling or disassembling. The inside of the frame is bored to form a continuous finished seat for the reception of the poles.

Poles

The main poles are of laminated steel accurately punched. Commutating poles are made from rolled steel stock. All poles together with their coils are easily removable without disturbing the magnet frame or brush rigging.

Fields

The main field coils are wound on metal spool bodies with a series coil mounted outside of the shunt coil with large ventilating space between. The commutating field coil is a helical winding of copper wound edgewise, permitting a most effective heat radiation.

Armature

The armature core is built up of soft steel laminations thoroughly annealed after punching. Large air ducts are provided to insure perfect ventilation. Commutator segments are of selected hard drawn copper insulated from each other by high grade mica segments of proper hardness to insure even wear and sparkless operation. The commutator face is extra long, permitting the brushes to be staggered.

Brush Rigging

The commutating poles permit a permanent setting of brushes at the electrical neutral throughout the entire range of operation.

Prices and data on application.

Western Electric DIRECT CURRENT GENERATORS

Steam Engine Driven Generating Sets

Type DSD Generator with Oil Ring Bearings

MARINE GENERATING SETS—2½ to 75 K.W.

Western Electric Engine Driven generating sets, while especially designed for marine use where limited space is available, are also well adapted for power and lighting service and isolated plants. The direct current sets are particularly suitable for excitors in large central stations.

The valve is of the balanced piston type accurately ground. The piston is equipped with hard cast iron spring rings which effectively prevent leakage of steam.

A simple and efficient automatic governor varies the steam admission by the motion of the eccentric forming a part of the governor weight.

The generator frame is a selected high grade iron cast in one piece with the exception of the 50 K.W. size, which is horizontally split. Soft steel poles are rigidly bolted to the frame. The armature is built of high grade sheet steel laminations pressed on an iron spider provided with numerous ventilating ducts. The armature coils are form wound and thoroughly insulated before being placed in the slots. The field coils are liberally designed and provided with numerous ventilating ducts and thoroughly insulated.

Sizes 25 to 60 K.W. can be furnished with alternating current generators, with or without direct connected exciter, or with shaft extension for mounting exciter driving pulley.

Prices and data on application.

Belt Driven Direct Current Generators

The small electric generator furnishing electricity for lighting and power for small tools, such as buffing and grinding outfits, ventilating outfits, vacuum cleaners, etc., has proven itself a highly necessary adjunct to small machine shops, garages, etc. The universal application of the small electric motor to various household duties, as well as to numerous duties to be met with on farms and in country places, such as sharpening tools, operating separators, churners, washing machines, etc., has found in the small direct current generator a most economical and simply operated source of power.

Prices are F. O. B. factory, boxed. Prices and shipping weights include pulley and field rheostats but do not include base frame. If base frame is desired an additional price should be added as per the above column for sliding base, and this base frame should be specially called for on the requisition.

The above machines are not to be used as exciters.

*Delivery: F. O. B. Factory, Lynn, Mass. For warehouse deliveries write nearest house.

Western Electric

DIRECT CURRENT GENERATORS

Type CVC Commutating Pole Generator with Pulley and Base

Type DLC Direct Current Generator for Belt Drive

Types CV and CVC—1¼ to 20 K.W., 125 and 250 Volts

The economy and simplicity of operation and maintenance of the modern electric generator are factors which make it profitable for the user of electric power in quantities up to 20 k.w. to install a generator and be independent of outside sources for his power and lighting.

The low first cost and the adaptability to varying conditions of the belt-driven generators of the Western Electric Types CV and CVC make them especially acceptable for this form of service.

Their success, as measured by their universal use, testifies to the high operating characteristics and general service reliability which are the predominating features of these generators. The most modern improvements in electrical design have been incorporated in the construction, and many improved mechanical features have been adopted. Commutating poles are used in the CVC generators, insuring sparkless operation at all loads, and the use of ventilating fan on the armature shaft results in cool operation and a good overload capacity.

*Prices are F. O. B. factory, boxed, Lynn, Mass. For warehouse deliveries write nearest house. Prices and shipping weights include sliding base, pulley and field rheostat. The 125 volt CV and CVC machines only may be used as exciters with or without TA regulators without change. Compound wound exciters will be furnished unless otherwise specified.

Type DLC—10 to 150 K.W.

The successful operation of a central station or isolated plant furnishing electric service for lighting and power purposes is wholly governed by the type of generator installed. To operate a plant with strict economy and absolute reliability, it is necessary to have a generator of unquestionable characteristics, which can be depended upon to do the work for which it is guaranteed.

The Western Electric Type DLC direct current generator is universally recognized as the standard for installations requiring units of from 10 to 150 k.w. capacity. It embodies the most advanced methods and ideas in its electrical and mechanical construction. The predominating features are the commutating poles, which insure sparkless operation and perfect commutation at all loads without shifting the brushes, and the additional ventilation obtained from the ventilating fan mounted inside of the frame on the armature shaft, permitting heavy overloads to be carried for long periods without excessive heating.

Prices and data on application.

Power Apparatus

Western Electric

DIRECT CURRENT GENERATORS

Western Electric Electrolytic Generator DEG Design

Electrolytic Generators DEG Design

The Western Electric Type DEG generator for use in electro-metallurgy is furnished in five sizes. The $1\frac{1}{2}$ k.w. 250 amperes, and 3 k.w. 500 amperes at 1800 r.p.m. for 2 to 6 volts, are self-exciting and furnished with one commutator only. The larger sizes, 5 k.w., 10 k.w., and 15 k.w., with two commutators are separately excited, and have current capacities at 10 volts of 500, 1000 and 1500 amperes and at 5 volts of 1000, 2000 and 3000 amperes respectively. They may be equipped direct connected to an alternating or direct current motor for all standard voltages, or with pulley for belt drive.

Western Electric Type B Low Voltage Direct Current Generator Western Electric ML No Flicker Generator

Belt Driven Low Voltage Generators

$\frac{1}{2}$ TO 9 K.W.

The Western Electric Type ML and Type B direct current generator is especially adapted for service requiring a low voltage generator of from $\frac{1}{2}$ to 9 k.w. capacity. The voltage of this generator is from 30 to 35 volts, and they are extensively used in low voltage isolated plant installations.

The Type B generator has been adopted as standard by the Electric Storage Battery Company for the isolated plants which they handle.

No Flicker Generator

FOR GAS ENGINE DRIVE

The Western Electric Type ML generators are peculiarly adaptable to gas engine belt drive. They have proved exceptionally valuable in isolated plants and small central stations due to their service reliability and economy of operation and maintenance. A line of these generators wound for low voltage is especially adapted to charging storage batteries. Smooth operation and excellent voltage regulation are insured by a perfectly balanced flywheel supported between pedestal bearings.

Ratings

The Type ML generators range in capacities from $\frac{1}{4}$ to 16 k.w. for voltages of 35, 125, 250 or 550 volts and may be shunt or compound wound. The standard accessories supplied with each generator consist of pulley, base, flywheel and rheostat.

PORTABLE DRILLS

Model A

Model O

Western Electric Portable Electric Drills

Model A Drill. This tool was designed for drilling in either metal or wood. It will run on either alternating or direct current. The offset spindle allows drilling in close corners. The main driving spindle is run in a tobin bronze bushing, two inches in length. The lower handle can be readily removed when necessary.

The body is made of aluminum thoroughly strengthened and supported where the strain is most severe. Arrangements are made for positive and effective oiling for the motor shafts, driving spindle and all parts that are subjected to wear. The gears are accurately machined and run in grease. This drill is very light and convenient to handle. It is especially useful for drilling in sheet metal of all kinds. Also for drilling name plate and oiler holes and for light drilling in wood.

Model O Drill. Specially designed for drilling in cast iron, brass and other soft metals. Also for light drilling in wood.

The general construction is similar to Model A drill except in Model O drill the chuck spindle is in the center of the motor body and is directly connected to the motor shaft without gear reduction. The chuck spindle runs in a tobin bronze bushing of ample bearing surface; will operate on either alternating or direct current.

Western Electric

HAMMERS

No. 2 and 3

No. 4 and 6

No. 7

Electric Hammers

These hammers will do the work of pneumatic tools of like capacity at about 15% of the power cost and without the expense and inconvenience of compressor, air piping hose, etc. Over hand work, the economy is from 80% to 90%, and it is by no means uncommon for a tool to save its cost in a week. Every tool is controlled by a switch mounted in the handle and equipped with flexible cord and plug. They may be attached to any lamp socket.

These hammers are built in two types: For direct current and for universal service. The Universal tools operate on either direct current or alternating current of any commercial frequency. These tools are particularly adapted for putting up fixtures on a concrete ceiling, dressing French burr stones in a paint mill, cleaning scale off of condenser tube, for channeling plaster in an office building, for bush hammering a concrete wall, for drilling solid concrete, drilling for pipe racks in a brick wall, chipping gray iron castings, cutting openings for I beams, etc.

Supporting stands are strongly recommended for all overhead work. The use of these stands takes the jar and strain off the operator and keeps the tool pressed tight against the work.

The proper selection of steels to be used in different kinds of material is extremely important.

Electric Hammers

DIRECT CURRENT ONLY—110 OR 220 VOLTS

Type	Capacity in Concrete Diameter	Power Cons. in Watts	Blows per Minute	Net Wt. in Lbs.	Shpg. Wt. in Lbs.	List Price Each

**These speeds are "synchronous" for alternating current motors and "full load" for direct current motors.

Motors listed above are the so-called domestic buffing and grinding outfits and consist of totally enclosed motor mounted on a high base and furnished with separable straight shaft extension attachments on both ends, together with a 3½ inch rag buffing wheel and a 3 inch emery grinding wheel, which are included at prices indicated, and may be used as separate sale prices as well as allowances.

The single phase motors are provided with solid armatures, i.e., without clutches. The above motors are not furnished for two or three-phase circuits.

Attachments for Small Power Motors

A—3½ inch rag buffing wheel, B—3 inch emery grinding wheel, C—Straight spindle shaft attachment, D—Taper spindle shaft attachment, E—Star chuck attachment.

Western Electric

INDUCTION MOTOR STARTING SWITCHES

CR-1031 Starting Switch with Cover Open

CR-1038 Motor Starting Switch and Box

Type CR-1031 Starting Switch

Enclosed Overload Relays—Low Voltage Release

The CR-1031 Starting Switch has been designed for throwing small squirrel cage motors directly on the line. The construction is the same as that of the standard CR-1034 Compensator except that the overload relays are mounted in the space occupied by the compensator coils. The overload relays afford absolute protection to the motor against overload, and running single phase.

The time element of the overload relays may be varied so that the motor is not disconnected from the line with every fluctuation of load, but is protected against serious overloads.

Overload relays protect the motor from running single-phase.

The starting switch is provided with a hinged cover and snap catch.

CR-1031 switches have the following features: Switch contacts are oil immersed, insuring long life. All parts are totally enclosed.

Overload relays protect the motor from overload and have a wide range of adjustment.

List No.

CR-1031	Switches for squirrel cage induction motors up to and including $7\frac{1}{2}$ H.P., 110, 220, 440 and 550 volts.	*List Price \$24.00
---------	---	------------------------

CR-1038 Starting Switches

The CR-1038 Starting Switches are especially adapted for connecting small A.C. motors directly to the line, and are suitable for use with motors up to and including 3 H.P. 110 volt, 440 volt, 550 volt and 5 H.P. 220 volt. The device consists of a double pole single throw quick make and break switch, and two special receptacles for protective plugs mounted on a slate base and totally enclosed in a sheet iron case with the operating handles projecting through the front and suitable holes in the bottom for leads. Overload protection is obtained by two time limit protective plugs which contain a stationary contact post with a heating coil and a fusible link binding a spring contact arm to the stationary post. The heating coils is in the motor circuit which also passes through the post link and contact arm. The time lag in the heating coil prevents the momentary starting current from causing the plug to open the circuit. Branch circuit fuses must be installed as specified in the Underwriters' code, as the protective plugs do not protect the branch circuit from short circuit. Each switch is provided with a locking plate so that the motor cannot be started until plate is unlocked. All padlocks require different keys, but two master keys fitting all locks will be furnished free of charge when 10 or more locks are ordered at the same time. The standard practice is to furnish protective plugs rated approximately 25% in excess of the full load motor current.

Protective Plug

List No.

CR-1038	Switch complete with two protective plugs and two extra links.	*List Price Each \$12.00

CR 1025 Motor Starters

Single Phase Motor Starters

Type CR 1027 for Squirrel Cage Motors

The Type CR-1027 starters are designed for starting Western Electric Type KS Squirrel Cage single-phase induction motors, and consist of a resistance-reactance coil assembled in a well-ventilated box, on the front of which is mounted a slate base containing the starting switch and no-voltage release.

The switch contacts are composed of renewable segments. One of these segments is made up of two parts, one part being connected to the resistance and the other to the reactance. A stop latch located underneath the starting arm prevents the operator from throwing the arm to the running position without first stopping on the starting segment.

The 10 and 15 H.P. starters are provided with tap on the starting resistance-reactance so that the starting torque can be changed to meet service conditions. Taps are not necessary on the smaller sizes.

Ordering Directions

When ordering CR-1027 starters the H.P., voltage, speed, frequency and serial number of the motor with which it is to be used should be clearly stated.

Type CR 1025 for Repulsion Motors

The Type CR-1025 starting rheostats have been designed primarily for use with the Western Electric single-phase repulsion motor (Type RI) where the inrush of current resulting from throwing the motors directly upon the line is objectionable. When these motors are started by being thrown directly upon the line they require from 2 1/2 to 3 1/2% of full load current. While in many cases this starting current may not be objectionable, it is recommended that a starting box be installed in every case with the 7 1/2, 10 and 15 H.P. motors and with the smaller motors where it is desired to reduce the starting current. When a starting box is used, the inrush of current at the instant of starting is approximately 1 1/2 full load current.

These rheostats are for starting duty only where the starting period does not exceed one minute.

CONTROLLING DEVICES

FOR ALTERNATING CURRENT MOTORS

Compensator with Fuses, Lever
and Oil Tank Removed

Compensator with Overload
Relay Panel

Illustrating the Compactness
of Compensator

Type CR 1034 Starting Compensators for TWO AND THREE PHASE SQUIRREL CAGE INDUCTION MOTORS

The Form K, or squirrel cage, motor can be started by simply closing the stator or primary switch, and the motor will then carry its load up to nearly synchronous speed, but with a large inrush of current at the moment of starting.

In order to reduce this current, when the maximum starting effort is not necessary, a Type CR-1034 Starting Compensator is employed. This compensator acts as a transformer, reducing the potential at the terminals of the motor and consequently diminishing the current taken by it.

The compensator consists of coils (three for three phase and two for two phase) wound upon laminated iron cores, and an oil type switch assembled in a suitable case. The switch in the off position is held by a latch in such a way as to prevent its being thrown directly into the running position.

SALIENT FEATURES OF WESTERN ELECTRIC COMPENSATORS

The handle cannot be left in starting position.

The handle cannot be moved to running position without first going to the starting position.

The low-voltage release opens the circuit in case of failure of voltage.

Fuses or overload relays open the circuit in case of overload.

Switches are oil immersed, thus eliminating sparking and insuring long life of contacts.

Compound treatment of the coils makes them practically waterproof.

Simplicity of wiring.

Accessibility of taps and contacts.

See following page for prices.

Prices cover compensators complete with no-voltage release and oil for switch tank. They also include fuses and fuse bases for compensators of 550 volts or less, and overload relays with enclosing covers for 2200 volt compensators.

EXTRAS

For overload relays with enclosing covers in place of fuses for 550 volts or less add \$28.00 list to the above prices.

If enclosing covers for conduit wiring are desired add \$48.00 list for sizes 1 and 2, and \$53.00 list for sizes 3 and 4, to prices of the compensators with overload relays or fuses.

For overload relays and ammeter, add \$84.00.

For overload relays, ammeter and conduit wiring case, add \$108.00.

For enclosing covers for fuse panels, add \$5.00.

*Add \$30.00 list to the above 2200 volt prices for a Mfr. No. 127108 potential transformer unless there is a low-voltage (550 or less) alternating current circuit available for exciting the no-voltage release coil.

CONTROLLING DEVICES

FOR DIRECT CURRENT MOTORS

For Series, Shunt or Compound Wound Motors

Fig. 1

Fig. 2

Fig. 3

CR-1000 Direct Current Motor-Starting Rheostats

CR-1000 rheostats are recommended for use with motors which, when not overloaded in starting, will attain full speed in one minute or less. They can also be used for starting motors overloaded 50 per cent., providing the resistance is not in circuit over thirty seconds. These rheostats have been so designed that they comply with the service rules of the American Institute of Electrical Engineers, viz., one minute starting duty every four minutes for one hour.

Fig. 3 illustrates the type of starter used above 35 H.P., 115 volts, 50 H.P., 230 volts, and 20 H.P., 550 volts. This starter comprises a knife-blade type of dial switch so interlocked with a line contactor as to provide low-voltage release as well as positive making and breaking of the circuit. This contactor is also provided with a magnetic blowout coil.

The motor circuit is not made or broken on the dial switch and no arcing can possibly occur thereon.

The contactor when once opened can be closed again only with the starting arm at the initial starting point.

Resistance units throughout this entire line of motor-starting rheostats are absolutely fireproof. CR-9000, Form P resistance units are used in the following sizes:

$\frac{1}{8}$ -5 H.P. inclusive, 115 volts. $\frac{1}{8}$ -7 $\frac{1}{2}$ H.P. inclusive, 230 volts. $\frac{1}{8}$ -20 H.P. inclusive, 550 volts. In the larger sizes cast grid resistance units are used.

In rheostats 2 H.P. and larger the Form P units are mounted on supports independent of the iron box the supports being fastened to the slate top of the rheostat; consequently the resistance can be removed for inspection or necessary repairs without disturbing the units or their connections.

150					157794	180.00	525	3	157806	160.00	400	3

The above prices cover rheostats with low-voltage release only.

Overload Release

If on sizes up to and including 35 H.P., 115 volts; 50 H.P., 230 volts and 20 H.P., 550 volts, an overload release is desired in addition to low-voltage release, add \$6.00 list to above prices. For larger sizes CR-1102 is recommended.

ORDERING DIRECTIONS

Rheostats with low-voltage release only should be ordered by Mr. No.

Rheostats with low-voltage and overload release should not be ordered by Mr. No., but order should give the H.P. rating and voltage of the motor, with the statement that the overload release is desired.

Western Electric

CR-1100 D.C. MOTOR STARTING PANELS FOR DIRECT CURRENT MOTORS Line Switch and Fuses

CR-1100 Starting Panels consist of standard CR-1000 Starting Rheostats and a double-pole line switch and fuses, mounted on a slate base. The resistance is designed for one minute starting duty once every four minutes for an hour. These panels are all arranged for wall mounting and are particularly recommended on account of economy of space, compactness and the added neatness given the complete equipment.

Overload Protection

These rheostats may be furnished with an overload release coil which in case of overload will short circuit the low-voltage release coil, allowing the starting arm to return to the "off" position.

CR-1200 D.C. SPEED REGULATING RHEOSTATS

For Shunt or Compound Wound Variable Speed Motors Only

CR-1200 rheostats are designed for use with variable speed motors, the speed control of which is obtained by varying the resistance inserted in the field circuit.

These controlling rheostats comprise a starting switch of the type used on CR-1000 rheostats. The starting switch is provided with a projection carrying a sliding contact which bears on the contact buttons connected to the field resistance. An auxiliary arm on the rheostat front retains a short circuit on the field resistance during the period of starting, and on the starting resistance after the motor attains normal speed. The short circuit is also retained on the starting resistance, when the starting arm is turned back to vary the running speed of the motor.

When starting the motor, the starting arm cannot be left in any position on the contact buttons until it has been turned to the right and engaged the auxiliary arm, forcing the latter to be retained by the low-voltage release coil. The auxiliary arm then withholds the spring which affects the starting arm, and thereby makes it possible to leave the starting arm in any position that will give the desired speed control of the motor. Upon failure of voltage the retaining coil is de-energized, releasing the auxiliary arm, which releases the spring that carries the starting arm to the "off" position, thus opening the motor circuit.

A feature is provided, however, so that it requires a little extra pressure to move the arm beyond the maximum speed point to call the operator's attention to maximum speed position so he will not unintentionally shut down the motor.

The contacts of the auxiliary arm are designed to take care of any possible arcing and in the larger sizes are protected by an auxiliary carbon block.

Overload Protection: These rheostats can be furnished with an overload release which in case of overload will short circuit the low-voltage release coil.

Fireproof and moisture-proof resistance units are used with the controllers as follows:

All field resistances; all starting resistances up to and including 10 H.P., 115 and 230 volts; up to and including 20 H.P., 550 volts, CR-9000 (Form P).

All starting resistances 15 H.P. and larger 115 and 230 volts, Cast Grid (Form C).

50	130.00	150.00	170.00	200

With low-voltage release only.

If overload release is desired in addition to low-voltage release, add \$6.00 list to above prices.

Ordering Directions: In ordering rheostats give H.P. rating and voltage of the motor.

If the rheostat is to be used with a W.E. motor, the order should be accompanied with the complete name plate rating of the motor. If the rheostat is to be used with other than a W.E. motor the order should be accompanied with advice as to the maximum shunt field current and the ohms necessary to insert in the field circuit to give the maximum speed increase.

In ordering rheostats with low-voltage and overload release include, in addition to above, the statement that the overload release is desired.

Delivery: F. O. B. Factory, Schenectady, N. Y. For warehouse deliveries write nearest house.

NOTE: Motor Agents, U. S. Government and Machine Manufacturers, consult Specialist.

CONTROLLING DEVICES

FOR DIRECT CURRENT ADJUSTABLE SPEED MOTORS
ARMATURE CONTROL—MACHINE SERVICE

CR-1220 Speed Regulating Rheostats

CR-1220—Renewable Segment Type Speed Regulating Rheostat

CR-1220 speed regulators for machine service are designed to reduce the speed of the motor 50 per cent. from normal at full load by inserting resistance in the armature circuit, the resistance and switch contacts having ample capacity to carry the current continuously on any point without overheating. These rheostats should be installed with motors where the same amount of current is required at half speed as at full speed. CR-1220 rheostats are equipped with renewable segments which may be easily replaced from the front of the rheostat should they become worn or pitted by frequent operation.

The retaining coil for low-voltage protection is connected across the line in series with a high resistance and is, therefore, independent of the strength of the motor field current. This permits the same rheostat to be used with either shunt, series or compound wound motors.

In the large sizes the motor circuit is made and broken by a contactor and not on the switch contacts, thus preventing arcing and subsequent burning of these contacts. A rugged knife-blade type of switch is used, with segments that can be renewed, if desired, but this is seldom necessary, as all arcing is handled by the contactor, which is provided with a strong magnetic blowout, and all parts liable to wear are renewable. The switch is interlocked with the contactor, so as to provide low-voltage protection.

With Overload Release

These rheostats can be furnished with an overload release which in case of overload will short circuit the low-voltage protective coil.

*Rheostats equipped with contactor for making and breaking the armature circuit.
The above prices cover rheostats with low-voltage protection only.

Overload Release

If overload release is desired, in addition to low-voltage protection, add \$6.00 list to above prices for sizes up to and including 15 H.P. 115 volts, 25 H.P. 230 volts and 20 H.P. 550 volts. For overload release on larger sizes prices will be furnished on application.

ORDERING DIRECTIONS

Rheostats with low-voltage protection only should be ordered by List No.
Rheostats with low-voltage protection and overload release should not be ordered by List No., but order should give the horse power rating and voltage of the motor, with the statement that the overload release is desired.
Delivery F. O. B. Factory, Schenectady, N. Y. For warehouse deliveries write nearest house.

111484	1	40.00	111487	1	40.00	111490	1	40.00
111485	2	48.00	111488	2	48.00	111491	2	50.00
111495	3	60.00	111496	3	60.00	111497	3	66.00

†Note Carefully—Voltage Variation

All of the above starters are suitable only on circuits where the line voltage is never more than 10 per cent. lower or higher than the values given above.

CR-2301 and CR-2303 Self-Starters are designed for use with motor-driven pumps where it is desired to automatically start and stop the motors depending upon a predetermined change in fluid level, fluid pressure or air pressure. They are, however, well suited to start and stop motors by hand control from points remote from the motor.

Delivery F. O. B. Factory, Schenectady, N. Y. For warehouse deliveries write nearest house.

PRINTING PRESS CONTROLLERS

Descriptive and General

Printing press dial controllers have been designed primarily for controlling printing press motors where the variation in speed is obtained by inserting resistance in the armature and the shunt field circuits. They can be used with variable speed motors driving machine tools, etc., provided one reverse point is sufficient, and it is not necessary to operate the controllers continuously in the reverse direction.

Fig. 1
Open Type Controller

Fig. 2
Enclosed Type Controller with
Cover in Position

Fig. 3
Back View of Enclosed Controller
Showing Field Resistance
Mounted on Back of Slate Panel

Open and Closed Type Controllers

Two styles of these controllers have been designed, the enclosed type and the open type. In the open type, illustrated by Figure 1, no enclosing cover is furnished and the resistance is mounted in a ventilated box, and attached directly to the slate front. In the enclosed type, illustrated by Figure 2, the slate panel and field resistance are mounted in a cast iron case.

The enclosing cover supplied with the enclosed style of controller may be easily removed for inspection and repairs without the use of tools. The connecting wires to the external circuits pass through slots in the bottom of the case. The control handle projects through a slot in the front of the case, and in this manner the enclosing cover affords complete protection to the operator.

The control arm may be left on any of the armature or field resistance points, and a notched rack is provided for centering it on any segment.

All circuits are made and broken on a contactor, thus preventing arcing on the switch contacts. The movement of the operating lever in either direction energizes the contactor, which closes the motor circuit. Should the contactor coil be de-energized either by the overload device picking up or by failure of voltage, the contactor will open and the operator must return the controller handle to the off position before the contactor can be closed.

With the controllers having a reverse point, the handle is provided with a spring which prevents the operator from leaving it on the reverse point, as the handle will return to the off position as soon as released.

The current carrying parts liable to wear, such as the starting, brake and reverse segments; the sliding brushes in the lever, and the parts of the contactor, can be easily removed from the front of the slate and renewed.

With some of the controllers dynamic braking connections are provided for bringing the motor to a quick stop. The connections are so made that, when the contactor opens, the brake resistance is automatically cut in the motor circuit.

Resistance

Each controller is furnished with separate resistances for the armature circuit, field circuit and, when required, the dynamic brake circuit.

Where the full load current of the motor does not exceed 60 amperes, the armature regulating resistance consists of CR-9000 Form P resistance units mounted in a well-ventilated sheet iron box as shown in Figure 4. The resistance is made up in one or more sections depending upon the size of the motor; the illustration showing a resistance consisting of two sections. It will be noted that the various sections are mounted upon the same supports and the resistance can be installed as a single unit. Ordinarily this resistance is placed under the press although it can be mounted upon the wall if desired.

See following page for further description.

Fig. 4
Armature Regulating Resistance

Western Electric

PRINTING PRESS CONTROLLERS (Continued)

Fig. 5
Dynamic Brake Contactor and Resistance with Enclosing Cover Removed

Resistance

With 10 and 15 H.P., 115 volt motors the full load current exceeds 60 amperes and a resistance composed of cast grid units is recommended.

The field resistance is composed of CR-9000 units and is self-contained within the controller, being mounted upon the back of the slate front as shown in Figure 3.

The dynamic brake resistance is also composed of CR-9000 units mounted in a box with a sheet iron cover as illustrated in Figure 5 with the exception of Types CR-6033 and CR-6022 in which the brake resistance is self-contained and is applied through an interlock on the line contactor. In all the other types where the dynamic brake feature is used, a separate contactor is mounted on the box referred to above. This contactor is energized by an interlock attached to the main line contactor.

CONTROLLING POINTS

The following tabulation gives the number of forward speed controlling points:

Horse Power	Voltage	Controlling Points	
		Armature	Field
CR-6001, *6013, 6020, 6021, *6032 AND *6034			
1 to 7½ incl.	115	5	15
8 to 15 incl.	115	7	17
1 to 10 incl.	230	5	15
11 to 15 incl.	230	7	17
1 to 5 incl.	550	5	15
6 to 15 incl.	550	9	9
CR-*6010			
All	115 and 230	8	None
CR-*6011			
All	115 and 230	7	7
CR-6002, *6012, 6022 AND *6033			
All	115 and 230	5	11

*Have one reverse point.

REMOTE CONTROL

Nearly all printing press controllers are adapted for remote control by means of push buttons which can be used for jogging or stopping the motor. If the operator closes the push button when the motor is not in operation, the contactor will close, completing the motor circuit through the armature regulating resistance. This will start the motor which will continue to run very slowly as long as the push button is held closed. If the push button is closed while the motor is running, the contactor coil will be de-energized, thereby opening the motor circuit and stopping the motor.

From the above, it is seen that the same push button can be used for jogging or stopping the motor. Any number of push buttons may be installed at various places about the press, each controller being furnished with two push buttons. Extra charge is made for more than two push buttons, prices of which will be found with the prices of controllers with which push buttons are used.

CONTROLLERS FOR SLIP RING INDUCTION MOTORS

A line of dial controllers has been developed for slip ring induction motors for use on printing presses. They are the CR-6050 type.

ORDERING DIRECTIONS

In placing orders for printing press controllers, the type and complete rating of the motor should be given. If the motors are other than Western Electric, it will be necessary to specify the maximum shunt field current and the amount of resistance necessary to give the desired increase in speed by field control.

CR 9000 G. E. RESISTANCE UNITS

Form P Resistance Units

Form PM Resistance Units

Form PE Resistance Units

Type P Resistance Units

In the construction of Form P resistance units, a low temperature coefficient resistance wire is wound on an asbestos tube making them non-fragile. After being wound the tube is treated with a special compound forming a coating inside and out, reinforcing the tube and imparting strength and solidity. A porcelain bushing is inserted in each end of the tube, the coating compound cementing it in place. The unit when thoroughly baked results in a very efficient unit, the coating being a good conductor of heat; this produces uniform radiation.

Form P units are extensively used in small motor starting and controlling apparatus and for armature and field resistance. They are also used as permanent resistances to protect circuit breaker coils, and as series resistance in signal work, etc. The units are mounted in punched end frames by means of porcelain bushings which insure good insulation from the frames.

Form PM units are similar to the Form P, except that metal bushings are used in place of the porcelain.

The Form PE unit is a special type of the Form P and is used extensively in connection with switchboard instruments. A special porcelain bushing is used in this type and the leads are attached on the inside of the tube. They are enclosed in perforated metal casings, to adapt them for switchboard mounting, which produces a neat appearance, and at the same time provides good ventilation and protection.

List Prices and Data Forms P and PM Resistance Units

Capacity Range Ohms	Range Ampere Capacity Continuous	List Price Each

Western Electric

BATTERY CHARGING RHEOSTATS

DESCRIPTIVE AND GENERAL

CR-9200 Battery Charging Rheostat

For charging automobile or other small batteries from circuits not exceeding 115 volts, we recommend the new CR-9200 battery charging rheostat. In order to meet more exactly the variety of charging conditions due to the different types and number of cells used in vehicle batteries, the previous line has been expanded. The rheostat is of very rugged construction, the frame being made of two iron castings which form the ends and which are fastened together with tie rods. A perforated sheet metal enclosing cover, which is easily removable, prevents accidental contact with live parts, but at the same time provides for ample ventilation.

A dial switch is entirely enclosed.

The cover is easily removed, allowing complete inspection and access to all parts. Standard grids and Form R resistances are used. Connection may be made on inside or outside of case as desired.

Large number of contacts insures close regulation.

Can be placed on floor, wall or switchboard.

Large number of sizes standardized.

Rheostats Mfr. Nos. 134605, 134606 and 134607 have been designed for use where it is desired to charge Edison batteries above their normal rate. The resistance is so proportioned that any charging rate from double normal to normal may be obtained.

Three of the above Mfr. Nos. cover rheostats for use in public garages where it is necessary to have a rheostat which may be used with more than one type of cell.

Delivery F. O. B. Factory, Schenectady, N. Y. For warehouse deliveries write nearest house.

Western Electric FLOAT SWITCHES

Single Pole Float—Open Type

Totally Enclosed Float Switch with
Cover in Place

CR-2930 Single Pole Float Switch

CR-2930 single pole float switches are used for remote control of automatic starting rheostats or panels together with the usual accessories, namely, float, chain pulleys and counterweight, for the automatic starting and stopping of motors when it is desired to maintain a predetermined water level on an open tank or reservoir system. The switch contacts are designed for handling pilot circuits for self-starters, or for controlling the main line circuits of small motors where the current does not exceed the values given in the table below.

List No.	Description	Amperes Capacity (A.C. or D.C.)	Wgt. Lbs.	List Price
58971	Single pole	$\left\{ \begin{array}{l} 15 \text{ at } 110/125 \text{ Volts} \\ 10 \text{ at } 220/250 \text{ Volts} \\ 5 \text{ at } 500/550 \text{ Volts} \end{array} \right\}$	20	\$9.00

Accessories for Use with the Above Float Switches

List No.	Description	List Price
58973	1 copper cylindrical float; 2 pulleys; 15 feet brass chain; 1 counterweight.....	\$9.00
These switches are not recommended for use where the freezing of the water in the tank will interfere with their operation. In this case a CR-2920 pressure governor should be installed.		

CR-2931 Totally Enclosed Float Switches

For Use as Either Tank or Sump Switches

CR-2931 enclosed switches are weatherproof and are suitable for tank or sump switches, in the case of the latter, it only being necessary to change the lever or the float from the right to the left side of the switch.

The switches are enclosed in a cast iron case arranged for 1 1/4 inch conduit which enters at the top. The lower half of the case is removable for making connections and inspection.

All sizes are suitable for 30 amperes, either alternating or direct current, up to 550 volts, when connected in a motor circuit and are also suitable for all control circuits.

To eliminate all arcing and burning of the contacts, the switch is arranged for quick breaking. This snap action is accomplished by means of a counterweight.

List No.	Form	No. of Poles	Wgt. Lbs.	List Price	List No.	Form	No. of Poles	Wgt. Lbs.	List Price
141636	A	S.P.	40	\$26.00	141644	C	S.P.	75	\$32.00
141637	A	D.P.	40	28.00	141645	C	D.P.	75	35.00
141638	A	T.P.	65	36.00	141646	C	T.P.	100	39.00
141639	A	4P.	65	40.00	141647	C	4P.	100	44.00
141640	B	S.P.	75	31.00	141648	D	S.P.	65	*32.00
141641	B	D.P.	75	33.00	141649	D	D.P.	65	*36.00
141642	B	T.P.	100	39.00	141650	D	T.P.	90	*44.00
141643	B	4P.	100	44.00	141651	D	4P.	90	*50.00

Form A is for clamping to the inside top edge of the tank and is operated by a rod and float. Range, 10 inches to 2 feet.

Form B is for bolting to tank cover and requires a guide in the cover for the operating rod. Range, 10 inches to 3 1/4 feet.

Form C is the same as Form B except that no guide is required in the tank cover. Range, 10 inches to 3 1/4 feet.

Form D is for bolting to tank cover and is operated by a chain and float, thus being suitable for any depth of tank or variation in water level not less than 10 inches.

Length of chain should be specified on all orders.

Motors of 1/4 H.P. and less, 115 and 230 volts, can be thrown directly on the line by means of float switch, pressure governor or knife switch.

*Prices for Form D switches include 15 feet brass chain. If more than this amount is required add \$0.20 for each additional foot.

Delivery F. O. B. Factory, Schenectady, N. Y. For warehouse deliveries write nearest house.

Western Electric

DIAPHRAGM PRESSURE AND VACUUM SWITCHES

CR 2925 Pressure Switch with
Metal Cover

CR 2925 Pressure Switch with
Cover Removed

Pressure and Vacuum Switches

The diaphragm pressure and vacuum switches are designed for the automatic control of electric motors which drive pumps for hydraulic or pneumatic water and vacuum systems. They are positive in operation and will open and close at a predetermined pressure with no danger of the contacts sticking or "freezing."

The bottom of a cup or pan-shaped body casting is closed by a flexible phosphor-bronze diaphragm. The switch mechanism is mounted on top of this casting. As the position of the diaphragm is varied by the internal pressure, its motion is communicated to the switch mechanism which in turn causes the switch contacts to open and close when certain ranges of movement of the diaphragm are reached.

The switch is of double-pole, quick-break construction and the current-carrying parts are exceptionally rugged and are capable of heavy overloads. The normal rating is 20 amperes at 110 volts and 10 amperes, 220 volts, either alternating or direct current.

Connecting cables are secured directly to stationary contacts eliminating the necessity of flexible connection to movable parts of the switch.

The pressure switch is supported by the $\frac{3}{8}$ inch supply pipe, requiring no other bracket or support.

The vacuum switch is provided with 3 feet for wall mounting.

Both the pressure and vacuum switches can be provided with either glass or metal covers.

The range of adjustment of each switch is given in the tabulation shown below. These valves are secured by tightening or loosening the spring.

Either glass or metal covers are furnished for all switches, vacuum or pressure. The Mfr. Nos. cover switches with metal covers. If a glass cover is required the order should read as follows—one CR 2925 (state vacuum or pressure) switch similar to Mfr. No. (give No.) except with glass cover.

SALIENT FEATURES

A phosphor-bronze diaphragm is used which is practically indestructible.

The current-carrying parts of the double-pole switch are entirely insulated from the mechanism.

The quick-break feature insures absolute rupture of all arcs.

Switch mechanism is positive in its action and will not vary with operating pressure.

Auxiliary contacts prevent switch contacts from burning.

Switching mechanism is totally enclosed.

These switches occupy a comparatively small space and weigh very little.

Western Electric

FIELD RHEOSTATS

For Direct Current Generators

CR-8000 AND CR-8001 D.C. FIELD RHEOSTATS

For Front and Back of the Board Mounting

Plate Type—Hand-Operated

CONSTRUCTION

In the construction of CR-8000 and CR-8001 field rheostats resistance coils of negligible temperature co-efficient are imbedded and held in place in a special cement, which is a particularly good heat conductor and electric insulator. As shown by Figure 1, the contact buttons are circular and are spaced a sufficient distance apart to prevent dirt or dust from accumulating and short circuiting them.

Fig. 1
CR-8000 Field Rheostats for Mounting in Front of Switchboard Panel

HANDWHEELS

In order to conform to the present standard switchboard practice, that is, of having instruments and fittings on the front of the board of a black finish, the standard handwheels supplied with these rheostats are of a highly polished black material, thereby adding greatly to the appearance of the rheostats, as well as furnishing a pleasing effect when mounted on the switchboard panel.

A polished brass handwheel can be supplied if necessary.

Fig. 2
CR-8001 Field Rheostats for Mounting on Back of Switchboard Panel

DRILLING TEMPLATES

In order to facilitate the drilling of switchboard panels on which these rheostats are to be mounted, drilling templates are always forwarded with the rheostats when they are shipped.

RESISTANCE

The resistance material used in field rheostats is an alloy which has a negligible temperature co-efficient, and which will not disintegrate under constant use. Hence the rheostats maintain constant resistance when in service. Attention is called to the large number of divisions of resistance in this line of field rheostats. It will be noted that the 10-inch plates have 35 divisions of resistance, the 12-inch plates have 50 divisions of resistance, and the 15-inch plates have 70 divisions of resistance. The advantages obtained by having a large number of divisions of resistance are evident, that is, the operator can maintain a very even generator voltage or accurately adjust the speed of motors when the rheostats are used for this purpose.

See following page for prices.

The above prices cover rheostats with black polished handwheel.

A polished cast brass handwheel (List No. 59286) can be furnished with CR-8001 back of panel field rheostats instead of the polished black handwheel, at an additional list price of \$8.00.

ORDERING DIRECTIONS

Rheostats should be ordered by List No. If front of the board mounting is wanted, call for CR-8000. If back of the board mounting is wanted, call for CR-8001.

Delivery F. O. B. Factory, Schenectady, N. Y.

For warehouse deliveries write nearest house.

Power Apparatus

C-H. MOTOR STARTERS

**FOR ALTERNATING CURRENT
MOTORS**

No. 9110

The motor starting rheostat listed is designed for use with single phase self-starting motors operating on either a 110 volt circuit of 60 or 133 cycles, or on a 220 volt circuit of the same frequencies.

The resistance used is of the ventilated tubular type, and is so arranged as to eliminate the effect of inductance and consequently to provide the highest possible power factor obtainable in starters of this type.

BATTERY CHARGING RHEOSTATS

C-H. Battery Charging Rheostats

The Battery Charging Rheostats illustrated are designed to meet every ordinary requirement of battery charging service.

To meet various requirements of installation several distinct types of battery charging rheostats are listed. Type A is designed for wall mounting, or for mounting on front of switchboard. Type B designed for back of switchboard mounting. Types C and E are intended for use in public garages or wherever it is necessary to assemble a number of rheostats in a bank so as to occupy the least possible space.

Types E and F are designed to meet the demand for a high grade Battery Charging Rheostat, handsome in appearance and provided with protective devices that will insure the battery against damage due to abnormal current conditions or carelessness on the part of the operator.

C-H. Battery Charging Rheostats (Continued)

For Individual Vehicle Charging Installation

Electrical Data and List Prices

The electrical data given below is based on the assumption that the line potential does not exceed 115 volts. If the potential is higher than this the voltage should be stated, as in such cases the conditions will call for a special rheostat.

In ordering from this list it is necessary to state both List No. of rheostat desired and specify type of rheostat as well, since each of the twenty-six List Nos. comprises five different types—A, B, C, E and F. Do not use the List No. alone, therefore, but place after it the letter indicating type of rheostat required, thus: 115A, or 330C, or 460E, etc.

Western Electric

125 and 250 Volt Direct Current Small Plant Switchboards

Typical Standard Unit Board for Two Generators and Seven Feeders

Back View of One of the Standard Panels, Showing Method of Arranging Connections

Wall Mounted or Floor Mounted on Supports 64 or 76 Inches High

FOR TWO-WIRE GENERAL POWER AND LIGHTING SERVICE

Double polarity panels, non-grounded operation are listed to control:
Generators, 0.8 to 120 K.W. at 125 volts; 1.6 to 240 K.W. at 250 volts.
MIC and MCC Motor-Generator sets, 0.2 to 13 K.W.
Feeders, 1200 amps., maximum, 1 to 9 circuits per panel.

Incoming lines, 2000 amps., maximum.
Bus tie circuits, 3000 amps., maximum.

APPLICATION

General. This line of standard switchboard units provides for a great variety of conditions in small plants where panels of simple and inexpensive design are required. Public service stations in towns and installations in industrial plants, particularly office buildings, hotels, apartment houses and department stores, are typical small plants where these switchboards apply.

Panel. Nos. 161700 to 162655 are for plants of the general class just referred to where there is but one generator, feeder circuit not exceeding six in number, and which will not be extended. They are the combination type, that is, the control for the generator and feeders is combined on a single panel with no provision for parallel operation of the generator.

Panel. Nos. 161700 to 162191, are for such installations (i.e., having one generator), where there are but one or two feeder circuits, and particularly in the latter case where the cheapest possible equipment is desired. The wall mounted panels are less expensive and can often be installed where space is not available for the floor mounted types. The instrument equipments shown meet varying price and operating conditions.

Panel. Nos. 162192 to 162655, differ in having a generator switch, single or double throw, in the number of feeder switches, and also in the case of the type of feeder protection. They, therefore, apply for installations having a single generator where the panels do not meet the following conditions:

Where there are more than two feeder circuits.

Where a two-circuit panel will take care of the feeders, but a generator switch is desirable for its added convenience in operating.

Where automatic circuit breaker protection is advisable for power or mixed power and lighting service.

Where outside direct current service at the plant voltage is available. The panels with double throw generator switches provide for this condition very conveniently, as the load can be transferred from the plant generator to the auxiliary service by simply throwing the generator switch from the upper to the lower clips.

Motor-Generator Outfits. Nos. 162656 to 162783, apply where a Western Electric MIC or MCC motor-generator set is installed and where there are one or two feeder circuits.

Panel. Nos. 162800 to 163370, apply for plants of the class referred to under the paragraph "General" which may or may not be extended; and where the initial installation may consist of the following combinations:

- One generator and one or more feeders.
- Two or more generators operating in parallel and one or more feeders.
- One or more generators, one or more incoming lines, operating in parallel, and one or more feeders.
- One or more incoming lines and one or more feeders.

Generator, incoming line or feeder panels are separate units, designed to line up with each other to form a switchboard, and panels can be added at any time to provide for an increased number of machines or circuits.

Generator and feeder panels can be selected with protective devices best suited to the character of the load and individual circuits.

The incoming line panels can be connected to an auxiliary source of supply to provide night or breakdown service; they also apply in plants where no generators are installed and all power is received from outside lines.

Of the panels Nos. 162800 to 163401 those listed with single throw switches connecting generators and feeders to a common set of buses apply to the average run of small plants under the conditions outlined in the preceding. The panels with double throw switches by which machines and circuits can be connected to either of two sets of buses apply especially in those plants where the power and lighting service is each important and where rapid fluctuations in the power load cause untoward variations of light load. Loads of the same general character can often be divided to advantage and circumstances of every day practice will indicate further applications of the double bus system.

The bus tie panels Nos. 163371 to 163401 apply only to double bus systems. They give an extra flexibility in operating which is sometimes useful in emergency.

Special plant conditions can occasionally be met by the use of panels arranged for both one and two sets of buses in the same board. The design permits this if special consideration is given to the order of assembly and selection of bus copper.

Western Electric

125 and 250 Volt Direct Current Small Plant Switchboards

CONTINUED

Details of Construction

Panels are set up in the factory before shipment with all equipment mounted and with connections and small wire bent to shape and completely assembled. Prices include boxing. Blue prints showing front and back views and wiring diagrams of individual panels are furnished with all panels ordered. Where panels are to line up as a switchboard, prints and wiring diagrams showing these assembled together will only be supplied by special arrangement. Publications will be furnished on request giving more complete information on devices briefly described below. Panels conform in all details of construction and equipment with the requirements of the National Board of Fire Underwriters.

Material of Panels. This is Penrhyn slate with a dull black marine finish. This slate has excellent insulating properties and is very strong mechanically. Natural black slate (Monsoon slate with oil finish), black enameled slate, and blue Vermont marble can be substituted.

Panel Pipe Supports. 1 and 1½ inch wrought iron pipe with malleable iron threadless fittings and threaded floor flanges. (A wooden sill is recommended for switchboards of more than one panel if sub-bases are added.) Brackets for wall mounted panels are malleable cast iron.

Finish. Current carrying parts on front of panel are natural copper, polished and lacquered. Others are dull black or black japan. Pipe supports are japanned.

Instruments. All of D'Arsonval pattern, polarity indicating. Scales are uniform throughout range. Instruments are dustproof, have smallest practicable air gap, specially hardened and aged magnets, light moving elements, high torque and very efficient damping. Type DE ammeters and voltmeters are specially designed for small direct current switchboards. Cases are practically flush mounted, an entirely new feature, and have all glass fronts with particularly legible scales. Type DK-5 combines both ammeter and voltmeter elements in one case. They are somewhat less expensive than the Type DE and admirably suited to small combination panels where long scales are not necessary.

Ground Detectors. Two lamp receptacle type, arranged to indicate continuously.

Potential Receptacles and Plugs. Have insulated escutcheon plates preventing accidental contact. Contacts are of brass and retain original shape and elasticity indefinitely.

Circuit Breakers. Type CP—Main contact brushes protected by carbon and metal secondaries; end on contact of brush laminations; studs and contact blocks drop forged in one piece from solid copper; breakers close easily and do not jar open; each breaker individually calibrated from approximately 50 to 150 per cent. of rating.

Type CG—Practically same electrical features as the Type CP, but differs in mechanical construction. Not designed for such severe duty, but suitable for small plant service as listed here.

Lever Switches. Contact studs and clip blocks are drop forged in one piece from solid copper; clips pinned and sweated in blocks; blades forged and machined from best hard drawn copper; true contact is guaranteed between blades and clips without grinding by means of emery, glass or similar substances. Cross bars are locked to blades, and handles permanently secured to handle studs.

Fuse Blocks. All adapted to N.E.C.S. fuses. Fuses themselves are not included, but may be ordered separately.

Terminal Lugs. Made from pure drawn copper tubing. Treated for sweating to cables.

Field Rheostat Supports. For wall mounted panels, supports are machine steel lugs. The support for floor mounted panels is a cast iron tripod. All types of supports, panel drillings, extension shafts and couplings, where included, are adapted only to Western Electric plate type rheostats, which are furnished with handwheels and dial plates.

Connections and Buses. Connections are bare copper rod or bar, buses are bare copper bar. Al copper is hard drawn and Mathiessen standard, 98 per cent. conductivity. Conductivity of connection is improved by bending to shape instead of using bolted or sweated joints. Cross sectional areas are determined by tests of actual heating effects rather than from current density values. Small wiring is of solid tinned copper wire with varnished cambric asbestos insulation, fastened to back of panel by metal cleats. Wiring is run in straight parallel lines with right angle bends as far as possible.

Bus Clamps and Supports. Clamps for attaching connections to bus bars are malleable iron, insulating bus supports are cast iron with porcelain insulators. Both clamps and supports are adjustable facilitating the addition of bus laminations if the station capacity is increased.

Heating. Panels are designed to carry indefinitely, currents equivalent to their full panel and circuit ampere ratings, with a rise of temperature in any part not exceeding 30 deg. C. above a surrounding atmosphere at 25 deg. C.

NOTE: In all component current carrying devices, as well as buses and connections, the determination of copper cross sectional areas is based on tests of actual heating effects. Experience has shown that this gives far more satisfactory results than the method of determination from current density values. This design in all cases secures the highest possible degree of conductivity with conservative heating limits and high switchboard efficiency.

Directions When Ordering

1. Order panels, accessories and extras by list numbers.
2. Give machine ratings with overload guarantees and sustained feeder currents.
3. Advise if any special order of assembly is desired.

Western Electric

125 and 250 Volt Direct Current Combination Generator and Feeder Panels

**GENERATOR AND FEEDER SWITCH IDENTICAL ON SINGLE CIRCUIT PANELS, OTHER
PANELS WITHOUT GENERATOR SWITCH**

NON-PARALLEL OPERATION OF GENERATORS ONLY

Panels having one switch are to control one generator and one feeder circuit. Panels having two switches are to control one generator and two feeder circuits.

Panela have fuse blocks in all circuits. Generators may be shunt or compound wound and driven by any form of prime mover or by motor, but no motor control or starting equipment is provided. These panels are not designed to line up with any others.

NON-PARALLEL OPERATION OF GENERATORS ONLY

Equipments of Panels

List numbers include the following material beside the equipment specified in detail below:

Panel, name plate, all main and small wire connections except those between panel, generator, rheostat and load points for which suitable terminal lugs are provided.

Fig. 1. One pilot-light lamp receptacle.

Two ground detector lamp receptacles.

One D-P-S-T. 250 volt, amp. lever switch (S) with N.E.C.S. fuse blocks of same ampere capacity for generator and feeder circuit.

Supports for front of board type field rheostat.

Brackets for mounting panel on wall.

Fig. 2. One 150 (or 300) volt Type DE flush model voltmeter.

One amp. Type DE flush model ammeter and shunt.

Two ground detector lamp receptacles.

One D-P-S-T. 250 volt, amp. lever switch (S) with N.E.C.S. fuse blocks of same ampere capacity for generator and feeder circuit.

Supports for front of board type field rheostat.

Brackets for mounting panel on wall.

Fig. 3 is like Fig. 2 except the ammeter is not included.

Fig. 4 is like Fig. 2 except the voltmeter is not included.

Fig. 5 is like Fig. 2 except the equipment includes, instead of the DE ammeter and voltmeter, one Type DK-5 combination voltmeter-ammeter and shunt with 175 (or 300) volt and amp. elements.

Fig. 6. One 150 (or 300) volt Type DE flush model voltmeter.

One amp. Type DE flush model ammeter and shunt.

Two ground detector lamp receptacles.

One D-P-S-T. 250 volt, amp. lever switches (S) with N.E.C.S. fuse blocks of same ampere capacity for feeders.

One amp. N.E.C.S. fuse block mounted on back of panel in generator circuit.

Supports for front of board type field rheostat.

Brackets for mounting panel on wall.

Fig. 7 is like Fig. 6 except the ammeter is not included.

Fig. 8 is like Fig. 6 except the voltmeter is not included.

Fig. 9 is like Fig. 6 except the equipment includes, instead of the DE ammeter and voltmeter, one Type DK-5 combination voltmeter-ammeter and shunt with 175 (or 300) volt and amp. elements.

Figs. 10 to 18 inclusive are like Figs. 1 to 9 respectively except that drilling and supports for mounting a back of board type rheostat directly on the back of panel are provided.

Figs. 19 to 26 inclusive are like Figs. 2 to 9 respectively except that panels are mounted on pipe supports with floor braces and a cast iron support and extension shaft with coupling is provided for mounting a back of board rheostat a few inches back of panel.

Lamps, rheostats, rheostat handwheels and fuses are not included. Fuses may be ordered separately. See Accessories page.

Wiring. See page of wiring diagrams. For Figs. 1 and 10, wiring No. 1 applies; for Figs. 2, 3, 4, 5, 11, 12, 13, 14, 15, 20, 21 and 22, wiring No. 2; and for all others wiring No. 3.

Ratings. 125 volt panels have a range in voltage of 100 to 140 volts, and 250 volt panels of 200 to 250 volts. The panel ampere ratings given are the maximum currents the panels are designed to carry continuously in the generator circuit. See a panel having a rating not less than the generator current including the guaranteed 1 or 2 hour overload capacity of the machine.

Feeder circuits will carry currents continuously not greater than the ampere capacity of the switches. Ampere capacity of instruments, switches, etc., corresponding to the different panel ratings are given in the table below.

Panel Rating	Ammeter	S	Switches	S1	Generator Fuse Block	Panel Rating	Ammeter	S	Switches	S1	General Fuse Block

WESTINGHOUSE CIRCUIT BREAKERS

Single Pole Type C Circuit Breaker

Two Pole Type C Circuit Breaker
Separate Handles Can Be
Furnished If DesiredType C Circuit Breaker
With Equalizer Contacts

Type C Carbon Circuit Breakers

For Voltages Up to 750 A.C. or D.C.

Westinghouse Type C Automatic Circuit Breakers are designed for severe service. They have an exceptionally long break and act quickly and accurately. These breakers have been tested by many years of actual service and have successfully opened the heaviest short circuits that have occurred on the largest power systems.

The brush is made up of thin laminated copper and closes under pressure against flat contact blocks. **The Finish.** Cast parts are black enamel. Current-carrying parts are made of polished copper.

Connection. These breakers are made for rear connection only.

Capacity. Direct or alternating current circuits of 750 volts or below. When used on an alternating-current circuit, however, a larger breaker will be required for a given capacity than on a direct-current circuit, due to skin effect and eddy current heating.

For capacities greater than 1500 amperes Type CA Carbon Circuit Breakers are recommended.

Calibration. The circuit breakers are calibrated to trip on loads of from 80 to 160 per cent. of rated load. The single pole breakers are calibrated on direct current unless otherwise ordered.

Automatic Operation. An overload tripping mechanism is furnished mounted on the plain overload breakers.

Adjustment. Individual adjustment is provided on each brush and the contact pressure should be properly adjusted when installed.

Care of Breakers. When installed in very dirty places the copper contacts must be kept clean and bright. Breakers that are rarely opened should be regularly cleaned and operated to secure good contact and insure prompt operation when needed.

Operation in Cement or Flour Mills. Carbon circuit breakers are not suitable for operation in cement mills, flour mills, plaster factories or any similar industry where acid fumes or flying particles of dust and dirt are present. Under such conditions the laminations of the brush contacts tend to spread, which may cause the breaker to heat and become unsatisfactory in operation. For operation in such places the installation of oil circuit breakers is strongly recommended.

Bases, Nuts and Terminals. The Mfr. No. and list price include breaker complete with nuts and terminals and mounted on black marine-finished slate bases.

Single Pole—Overload Release

List No.	Continuous Carrying Capacity Amperes D.C.	Range Amperes	List Price
14863	200	150- 300	\$136.80
14864	400	350- 600	144.00
14865	600	500- 900	149.76
14866	800	600-1400	165.60
14867A	1000	800-1600	177.12
14868A	1500	1200-2400	211.68

NOTE: When breakers are desired for use on alternating current circuits specify "Similar to style No. ——— except calibrated for ——— cycles alternating current."

See paragraph "Capacity." A.C. ratings furnished on application.

Delivery: F. O. B. Factory, Pittsburgh, Pa. For warehouse deliveries write nearest house.

Protective Apparatus and Switchboard Accessories

WESTINGHOUSE CIRCUIT BREAKERS

Type C Carbon Circuit Breakers (Continued)

MULTIPLE BREAKERS

In the standard multiple breaker each pole is provided with an overload trip mechanism. Each of these breakers is provided with a mechanical connection so that all the poles trip together, and a cross bar so that all poles may be closed simultaneously.

Calibration. Multiple breakers are calibrated on 25 cycle alternating current unless otherwise specified on the order. Breakers for direct current or 60 cycle alternating current circuits require special calibration and same should be specified on the order.

Barriers for mounting between the poles will be supplied when specially ordered at an extra list price of \$14.40 for each barrier.

Spacing. The standard spacing between the vertical center lines of all multi-polar breakers is as follows: 200 to 800 amperes rated capacity, 9 inches; 1000 and 1500 amperes, 1 inch. Special 16 inch spacing can be supplied on all sizes at a slight additional cost.

Type C Auxiliary Attachments

Equalizer Contacts. All single pole breakers can be equipped with equalizer brushes and contacts mounted transversely to the main brush and insulated therefrom. The capacity of the equalizer brush is one-half that of the main brush.

An overload trip can be supplied with these breakers mounted as follows:

First. In the main line only.

Second. In the negative line only and insulated from the breaker.

Third. In both equalizer and main line.

Prices. For circuit breaker with equalizer brush and contacts and one trip coil only—first and second methods of tripping—add 25 per cent. to list price of standard breaker.

For circuit breaker with equalizer brush and contacts and two trip coils—third method of tripping—add 50 per cent. to list price of standard breaker.

Shunt Trip Mechanism. A direct current shunt trip attachment arranged for mounting on the rear of the panel, with a tripping arm extending through a slot in the panel, can be supplied for use with any single pole or multiple Type C overload release circuit breaker. The trip mechanism projects about $4\frac{1}{4}$ inches from the rear of the panel. In ordering, full information should be given regarding normal direct current voltage, rated capacity, number of poles of breaker, and thickness of panel on which it is to be mounted.

Prices. For shunt trip mechanism add to list price of standard breaker \$14.40 for single pole and \$2.88 for each additional pole. The price includes mounting the trip on the panel, provided the order for same accompanies the order for the circuit breaker.

Shunt Trip Cutout. In every case where there is a possibility of the shunt trip coil remaining actively in the circuit after the breaker opens, a shunt trip cutout should be ordered. This cutout opens the trip-coil circuit simultaneously with the opening of the breaker. The contact is insulated from the breaker.

Price. For a breaker equipped with a single pole single throw shunt trip cutout 10 ampere, 1100 volt and under, direct current or alternating current, \$1.44 should be added to list price of standard circuit breaker. This price includes mounting when ordered with the breaker.

Signal Contacts. For the addition of signal contacts add the following prices to list price of standard breakers: S.P.S.T. 3 ampere, for circuits not over 1100 volts, alternating current or direct current, to close when breaker opens, \$5.76 D.P.D.T. 10 ampere, not over 1100 volts, alternating current or direct current, \$7.20. The price includes mounting, when ordered with the breaker.

Undervoltage Release. A direct or alternating current undervoltage release mechanism mounted somewhat similarly to the shunt trip device described above, but projecting about $4\frac{3}{4}$ inches from the rear of the panel, can be supplied. This device is separately reset by hand when closing the breaker proper. When used on alternating current, the undervoltage release must be connected so that it will not be in the circuit when the breaker opens. A shunt trip cutout also should be ordered if necessary. The undervoltage mechanism, if supplied with a proper series resistance, can also be used as a shunt trip mechanism by momentarily short-circuiting the coil. In ordering, complete information regarding nature of the circuit, normal voltage, and if alternating current the frequency, should be given. The price includes mounting when ordered with the breaker.

Price. For the undervoltage mechanism add \$25.92 to list price of standard breaker for single pole, and \$5.04 for each additional pole.

Underload Release. Type C carbon breakers can be furnished with plain underload or with both overload and underload release attachments.

The simple underload breaker is nearly identical in appearance with the standard overload breaker. The combined under and overload breakers have the underload release attachment mounted on the rear of the panel and projecting $4\frac{1}{8}$ inches therefrom. All underload attachments are reset by hand. Prices of these devices will be furnished on application.

An Extended Hand Closing Mechanism for closing a one, two, three or four-pole breaker, which is mounted at the top of the panel, with one handle located down on the panel, can be supplied and prices will be furnished on application.

A Remote Control Hand Operated Mechanism for operating breakers mounted on a separate panel at some distance from the contact panel, can also be supplied, and prices will be furnished on application.

Type CA Carbon Circuit Breakers

For Alternating and Direct Current

Type CA carbon circuit breakers are designed particularly for the severe conditions found in operating low voltage alternating current and direct current systems. They are made for circuits up to 14000 amperes capacity operating at 750 volts or less, and up to 1600 amperes at 1500 volts direct current.

Closing Circuit Switch. At a small additional cost a small magnetically retained switch, operated by the overload trip armature, can be added to the breaker for opening the closing coil circuit if an overload exists, thus permitting the breaker to open independently of the operator and position of the control switch.

Finish. The finish of the circuit breaker conforms to that of Westinghouse standard switchboards; the cast parts are black marine, and the current-carrying parts are polished copper.

Mounting. These circuit breakers are designed for switchboard mounting and for separate mounting. For separate mounting they are furnished with a slate base with black marine finish. When furnished separately for switchboard mounting they are shipped mounted on slate or scrap marble template.

Connections. All type CA circuit breakers are arranged for rear connection. The main contact blocks form part of the terminal studs.

Electrically Operated Breakers. The electrically operated type is closed by means of a solenoid mounted below the main mechanism. The solenoid is equipped with a dashpot device to take care of the shock at the end of the closing operation and yet permit the breaker to be closed more quickly than is ordinarily possible with any other form of mechanism. When the closing switch is thrown, current flows through the solenoid and the plunger is drawn down. This closes the contacts, which are held closed automatically by a latch. When the closing circuit is opened, the solenoid plunger rises so that it will not retard the opening of the breaker when tripped. The breaker is opened by the overload trip or a shunt trip attachment mounted at the side of the mechanism. Standard closing coils and shunt trip coils are wound for all standard voltages: 125, 250, 600 or 750. A small plunger switch automatically opens the shunt trip circuit when the breaker trips and opens or closes the circuit of the signal lamps when used.

Multipole Circuit Breakers. Type CA circuit breakers are furnished with one, two, three or four poles, closed separately and tripped together. Each multipole breaker is provided with "common trip," that is, an overload on any one pole trips all the poles. Multipole breakers for potentials over 300 volts must be supplied with barriers between poles.

Alternating Current Circuit Breakers. Owing to the "skin effect" and eddy current heating in alternating current conductors, a circuit breaker has a lower alternating current rating than direct current rating, with the same rise in temperature. The alternating current rating of a circuit breaker is increased by the use of laminated studs, which are therefore used on larger capacity circuit breakers for alternating current service. These laminated studs will be supplied of any length desired, and arranged with the laminations running either vertically or horizontally, or with one stud with vertical and the other stud with horizontal laminations.

Prices and Manufacturer's Numbers

The list price and manufacturer's number include the circuit breaker complete, ready for installation, with three nuts per stud where round studs are supplied, but without any cable terminals. The switchboard mounting styles are shipped mounted on a scrap marble template. The separate mounting styles are shipped mounted on a black marine slate base. When cable terminals are required for use with these breakers and more nuts are required than three stud, they should be ordered separately.

List prices and discounts of multipole breakers are the same per pole as for single pole breakers with the additional price for barriers if they are required.

See following page for prices.

*In ordering automatic circuit breakers give the Mfr. No., current, and calibration desired, and specify whether for direct current 25 cycles, or 60 cycles.

†In ordering non-automatic circuit breakers, order "same as Mfr. No. but with automatic features omitted," and give current rating and whether for direct current, 25 cycles, or 60 cycles. The price of non-automatic will be the same as that of automatic circuit breakers.

††In ordering laminated stud circuit breakers state length of studs wanted and whether the laminations are to be horizontal or vertical.

†††Calibration. The standard calibration of circuit breakers carried in stock is 80 per cent. to 160 per cent. of the direct current rating. If specified on the order the circuit breakers will be calibrated for a range from 80 per cent. to 160 per cent. of either value given in this column or of any intermediate value in steps of 500 amperes.

Auxiliary Parts

Barriers, for mounting between the poles of multipole breakers to prevent arcing over are recommended for voltages above 300, and for all voltages when poles are placed closer together than standard spacing.

Shunt Trip Mechanism. A direct current shunt trip attachment arranged for mounting on the front of panel, can be supplied for any hand-operated type CA circuit breaker. In ordering, give direct current voltage, rated capacity, number of poles of breaker, and thickness of panel. If the circuit breaker does not cut out the shunt trip circuit, signal contacts, described below, should be provided to do this when the circuit breaker trips. Shunt trip mechanism is included in each electrically-operated circuit breaker.

Undervoltage Release. A direct or alternating current undervoltage release mechanism projecting about 4 1/4 inches from the back of panel can be supplied. This device is separately reset by hand when closing the circuit breaker. The undervoltage release mechanism, if supplied with a suitable resistor, can be used also as a shunt trip mechanism by momentarily short-circuiting the coil. In ordering give complete information regarding nature of the circuit, normal voltage, and frequency of alternating current.

Reverse Current. Reverse current trip can be supplied. Prices on application.

AUXILIARY PARTS

List price includes mounting if ordered with circuit breaker.

Description	List Price Each
Barriers for multipole circuit breakers	\$14.40
Shunt trip for 1 pole hand-operated breakers	17.23
Shunt trip for 2 pole hand-operated breakers	20.16
Shunt trip for 3 pole hand-operated breakers	23.04
Shunt trip for 4 pole hand-operated breakers	25.92
Undervoltage trip for 1 pole hand-operated breakers	30.06
Undervoltage trip for 2 pole hand-operated breakers	36.00
Undervoltage trip for 3 pole hand-operated breakers	41.94
Undervoltage trip for 4 pole hand-operated breakers	48.00
Signal contacts, 10 amperes, single pole-double break, double throw	7.20

Delivery: F. O. B. Factory, Pittsburgh, Pa. For warehouse deliveries write nearest house.

WESTINGHOUSE CIRCUIT BREAKERS

Fig. 1. Two-Pole Rear-Connected Breaker,
Without Barriers, Open PositionFig. 2. Three-Pole Front-Connected Breaker,
With Barriers, Closed Position

Standard Type CC Carbon Circuit Breakers

For Voltages Up to 750, A.C. or D.C.—400 to 800 Amperes

Application. Type CC carbon circuit breakers are intended for separate mounting or for use on motor starting or control panel switchboards on circuits of 400 to 800 amperes capacity where the voltage is 750 or less.

Caution. No carbon circuit breakers should be directly exposed to the severe conditions present in cement or flour mills, plaster or furniture factories, or similar plants where acid fumes or much dirt or dust are present. In case type CC circuit breakers are installed where dirt and dust are likely to accumulate, particular care should be taken to keep the contacts clean and bright. Breakers should be opened and cleaned regularly to insure good contact and avoid overheating.

Mounting. These breakers are furnished mounted on black marine finished slate bases which are included in the list prices and Mfr. No. When desired for use on switchboards, circuit breakers are removed from the slate bases and mounted directly on the switchboard panels.

Multipole Circuit Breakers. Type CC circuit breakers are furnished with one, two, three, or four poles. Each multipole breaker is provided with a "common trip," that is, all poles trip simultaneously. Separate closing handles for each pole with common trip can be supplied.

Calibration. Type CC circuit breakers are calibrated as follows: Single and double pole breakers on direct current; three-pole and four-pole breakers on 25 cycle alternating current. If other calibration is desired, it should be specified on the order.

If immediate delivery is desired and a maximum error of 10 per cent. in calibration is permissible, standard circuit breakers should be ordered for use on either alternating current or direct current circuits, thus eliminating the necessity for special calibration and the consequent delay in shipment.

Standard Type CC Carbon Circuit Breakers

Mfr. No. and list price include circuit breaker complete, with black marine finished slate base, terminal lugs, and clamping nuts, ready for installation.

List No. Front Connected	List No. Rear Connected	Amperes		List Price

WESTINGHOUSE CIRCUIT BREAKERS

Fig. 3 Breaker With Shunt Trip Attachment

Fig. 4 Breaker With Undervoltage Release Attachment

Fig. 5 Breaker With Under-Load Attachment

Type CC Carbon Circuit Breakers (Continued)

Shunt Trip. The shunt trip attachment consists of an electro-magnet and a small lever pivoted to the supporting bracket of the magnet. The magnet coil attracts one end of the lever, while the other end engages a small pin set in the trigger, and trips the circuit breaker. A shunt trip cutout, consisting of a contact pin mounted on the panel under the circuit breaker brush in such a way that the tripping-coil circuit is opened when the breaker opens, is also furnished with the tripping device. The current required to operate this device is from .1 to .9 ampere at the ratings given.

Undervoltage Trip. This device consists of an electro-magnet, the armature of which is attached to a tripping lever through a toggle mechanism. The magnet acts against the tension of a couple of strong springs so that when the line voltage fails the armature is released, causing the tripping lever to fly up and open the circuit breaker.

Only one undervoltage attachment is necessary with multipole breakers.

Underload Trip. This attachment, for rear-connected breakers only, consists of an electro-magnet, the coil of which is in series with the circuit breaker, and a weighted armature pivoted to the supporting bracket of the magnet. The armature has to be raised and set by hand. When the coil is energized, the armature is attracted and released from the catch holding it. Failure of current releases the armature, which falls approximately 90 degrees and strikes a small pin set in the trigger of the circuit breaker, giving a very positive trip.

Double Arm Attachment. This attachment eliminates the necessity for switches in series with a two-pole breaker and at the same time affords automatic protection to the circuit throughout the closing period. With this arrangement, each pole of the breaker is closed independently and in succession, so that the pole first closed is left free to open while the second or final pole is being thrown in. The breaker being closed, an overload in either positive or negative line, or both, will trip both poles simultaneously.

List Number and List Price include attachment complete. Where resistors are specified below, they are included in the list price but not in the List number, and must be called for separately in the order.

Shunt Trip Attachments

List No.	Series	D.C.	Volts	A.C.	Approx. Net Wt., Pounds*	List Price
Shunt Trip	Resistor

Two single pole breakers, if ordered mounted on one base complete with double arm attachment, will be supplied at the price of two single pole breakers.

Delivery: F. O. B. Factory, Pittsburgh, Pa. For warehouse deliveries write nearest house.

WESTINGHOUSE CIRCUIT BREAKERS

Type F
Automatic Breaker Open

Type F
Automatic Breaker Closed

Type F Circuit Breaker
With Shunt Trip Coil

Type F Carbon Circuit Breakers

Current Rating. The current rating of these breakers is maximum based on 30 degrees Centigrade temperature rise in conducting parts. A breaker should be selected that has a rating at least as great as the total one-half hour overload guarantees of the machine controlled.

The current-carrying contacts are copper and the arcing contacts are carbon and are readily renewable. The opening of the breaker is assisted by a spring.

Front and Rear Connection. Front-connected breakers are mounted on porcelain bases. Rear-connected breakers are shipped on wooden templates for remounting on switchboard panels 1 inch to 1½ inch thick.

Styles of Breakers

Automatic Overload. The operating solenoid is inside of a fiber tube forming the lever arm, adjustment of the tripping point being easily regulated by means of the knurled nut below the pivot. The tripping point may be set for any current within the range given in the table. A small insulating knob at the right controls the tripping device and offers a means of opening the breaker by hand.

Automatic Overload with Shunt Trip. By the addition of a shunt trip coil the Type F Circuit Breaker can be tripped electrically. The shunt trip does not interfere with the overload trip and the one circuit breaker affords protection from overloads and in addition permits opening the circuit from a distance or by an automatic device. This type of breaker is shipped mounted on a slate base.

These breakers are applicable to any installation where it is desired to open the circuit by means of a push button, a contact-making relay, a contact-making voltmeter, a speed limit mechanism, a tank float, or, in fact, any equivalent contact-making device.

Non-Automatic with Shunt Trip. These circuit breakers are non-automatic; that is, they do not open automatically when a predetermined value of current or voltage is reached. They are, however, equipped with a shunt trip to open the breaker from a distant point.

List Prices and Data

Mfr. No. and list price include breaker complete with base and terminals.

WESTINGHOUSE CIRCUIT BREAKERS

Type CD Carbon Circuit Breakers

Maximum Voltage 600, A.C. or D.C.

Application. Type CD carbon circuit breakers are intended for separate mounting or for use on motor starting and control panel switchboards and small installations where the capacity of no circuit exceeds 300 amperes and the voltage is 600 or less. The circuit breakers are rugged in construction, and well finished. The rear-connected breaker has the standard Westinghouse finish for switchboard apparatus.

Caution. No carbon circuit breakers should be directly exposed to the severe conditions present in cement or flour mills, plaster or furniture factories, or similar plants where acid fumes or much dirt or dust are present. In case Type CD circuit breakers are installed where dirt and dust are likely to accumulate, particular care should be taken to keep the contacts clean and bright. Breakers should be opened and cleaned regularly

Fig. 1—Single Pole Rear-Connected Breaker With Overload Tripping. Coil—50 Amperes, 600 Volts

Fig. 2—Two-Pole Rear-Connected Breaker With One Overload Tripping Coil—100 Amperes, 300 Volts

to insure good contact and avoid overheating.

Temperature Rise. These circuit breakers will carry their rated current with a maximum temperature rise of 30 degrees Centigrade, in accordance with the National Electrical Code.

General Construction. The type CD circuit breaker is closed by a toggle mechanism and held from opening by a trigger or latch. The various trip mechanisms operate to disengage this latch and permit the breaker to open. Current-carrying contact brushes are of laminated copper having high pressure contact with an excellent wiping or self-cleaning action. The circuit is broken by self-cleaning carbon arcing contacts to protect the main contacts from burning. The tripping mechanism is so arranged that any of the automatic tripping devices below can be used, or any combination of them.

Multipole Circuit Breakers. Type CD circuit breakers are furnished with one, two, three or four poles. Each multipole breaker is provided with "common trip," that is, all poles trip simultaneously. Breakers can have separate closing handles for each pole with common trip if desired at the same price as standard breakers.

Mounting. These circuit breakers are mounted on slate slabs, for separate mounting. If desired for mounting on panels thicker than the standard 1 1/4 inch base, the rear-connected breakers will be shipped on wooden templates or scrap slabs of the thickness specified. Price the same as for standard mounting.

Connections. Suitable terminals are supplied for front or rear-connected breakers.

Finish. Front-connected breakers have black lacquer finish. Rear-connected breakers have copper parts polished and laquered and the frame details have a velvety black finish.

Auxiliary Parts

Barriers between poles of multiple breakers are supplied where the voltage exceeds 300. The voltage should therefore be specified in every order.

Tripping Devices. All CD breakers will be supplied with overload trip unless otherwise ordered. Underload, overvoltage, under voltage, reverse current and shunt tripping devices can be furnished with these breakers. The standard number of tripping coils of the various kinds required for multiple circuit breakers is as follows: however, one coil per pole can be supplied for overload or underload tripping if specified.

Number of Coils Required

Kind of Trip	1 Pole	2 Pole	3 Pole	4 Pole	Kind of Trip	1 Pole	2 Pole	3 Pole	4 Pole
Overload.....	1	1	2	2	Undervoltage.....	1	1	1	1
Underload.....	1	1	2	2	Shunt.....	1	1	1	1
Overvoltage.....	1	1	1	1					

Special size of base is required when auxiliary trips are added to overload breakers. This base must be ordered separately when auxiliary trips are added to breakers already in purchaser's possession.

Auxiliary Contacts. To operate an alarm circuit, or to open the shunt trip circuit when shunt trip is used, special auxiliary contacts should be ordered. These contacts open when the breaker opens. Contacts can also be supplied to close or to open and close when breaker opens.

Special Bases

For Use With Front-Connected Underload Trip

11 Protective Apparatus and Switchboard Accessories

WESTINGHOUSE CARBON CIRCUIT BREAKERS
Type F Circuit Breakers
ELECTRICALLY OPERATED ACCESSORIES

**Type F Breaker
with Shunt Trip**

These auxiliary attachments may be applied to any standard type F carbon circuit breakers, either front or rear connected. They may also be applied, without interference with the existing mechanism, to type F breakers equipped with the standard shunt trip attachments. It will be necessary, however, to supply a wider base than is furnished with the standard breaker.

Mounting. The release attachment may be mounted on the right hand side of any standard type F carbon circuit breaker without interfering in any way with the existing mechanism of a standard breaker or one equipped with a shunt trip. When the breaker and attachment are mounted on the switchboard, no base is supplied and the apparatus is mounted directly on the panel. Drilling plan will be furnished on request.

Overvoltage Trip. The overvoltage attachment is used principally in connection with storage battery charging, where it is desired to cut off the current supply when the battery becomes fully charged. It may, however, be used in any alternating current or direct current circuit that it is desired to open automatically in case of either moderate or abnormal rise in voltage.

**Overvoltage Trip
Mechanism**

It has a shunt winding which raises a plunger that trips the breaker. On alternating and direct current circuits below 130 volts the coil is connected directly across the circuit, but in direct current circuits, over 130 volts, a series resistance is used. The tripping circuit may be entirely distinct from the breaker circuit.

The adjustment of the tripping range is easily made by varying the vertical location of the plunger by means of a knurled thumb screw which carries an index, located in the downward-projecting calibration tube. The tripping range is exceedingly wide, the maximum point being 100 per cent. greater than the minimum voltage calibration. No permanent magnets are used in the construction of this device. It trips the breaker directly and consequently requires no shunt-trip auxiliary attachment.

Electrically Operated Accessories

Mfr. No. of the mechanism includes the device complete with the necessary contact nuts, terminals, mounting screws for 1 inch to 1½ inch panel and necessary terminal clips, resistance (when required) and spring cut-out for opening the shunt coil circuit when the breaker is tripped. The Mfr. No., however, does not include the base or breaker proper, which must be ordered separately.

Protective Apparatus and Switchboard Accessories

WESTINGHOUSE CIRCUIT-BREAKER ACCESSORIES

Controlling Switch

Type AR Relay

Controlling Switch

The switch is used to actuate electrically operated circuit breakers. It allows the placing of all controlling apparatus within the reach of one operator and results in a considerable saving in wiring. It has a carrying capacity of 50 amperes, with a voltage not exceeding 500.

The controlling switches here listed are designed particularly for the control of electrically operated circuit breakers. The indicators show whether the remote circuit breaker is open or closed, and in some types, if open, whether it has been opened intentionally or tripped automatically, as the result of abnormal conditions on the circuit.

The hinged handle when thrown to the open position may be locked by swinging the handle outward so that it is in line with the drum shaft. It cannot be locked when in the closed position. When the handle is raised it indicates to the operator that the switch is out of service. The act of raising the handle cuts off the current from the controller and extinguishes the signal lamps.

List No. and list price include switch complete without indicators.

List No.	For	No. of	For Use With	List Price Each

73452A	1½ ins. thick	2	Circuit breakers and automatic synchronizers.....	28.80
73453A	2 ins. thick	2	Circuit breakers and automatic synchronizers.....	28.80

Indicators

Each indicator consists of a lamp receptacle projecting through the switchboard for holding a candelabra lamp, and a lens holder with a special prismatic lens. The lamp is removable from the front of the panel and the receptacle is provided with a glass tube fuse at the back of the board. The receptacle is arranged for mounting on 2 inch thick panel, but can be used on 1¼ inch and 1½ inch panels by the addition of an adapter. The lens holder is pushed into the end of the receptacle from the front of the board and is held firmly by spring clips. A special feature of the lens is the prismatic protection extending across its face, which make the indications visible from any position in front of the board.

List No. and list price of lamp receptacle include one fuse, but do not include a lamp. A 125 or 140 volt standard candelabra lamp should be used.

List No.	Description	List Price Each
154255	Lens holder with red lens.....	\$1.80

156145	Adapter for 1¼ and 1½ inch panels.....	.29
156096	Glass tube fuse.....	.08

Type AR, Reverse Current, Direct Current, Relay

This device closes the circuit through a circuit breaker shunt trip coil when the circuit is reversed. Designed particularly for use with battery charging apparatus. Operates when a reversed voltage of 25 millivolts is applied to coil terminals.

Price does not include shunt or tripping coil. The circuit breaker should have an auxiliary contact to open trip circuit when the breaker opens, thereby relieving the relay of this function. The contacts will close a tripping circuit of 1 ampere at 100 volts, or a proportionately lower current at higher voltage for switchboard mounting.

72826 Relay with leads 8 feet long..... \$22.32

Delivery F. O. B. Factory, Pittsburgh, Pa. For warehouse deliveries write nearest house.

G. E. CIRCUIT BREAKERS

FEATURES OF GENERAL ELECTRIC CIRCUIT BREAKERS

1. Can be furnished from stock in a greater and more complete range of ampere capacities (3 to 10,000 amp.) than any other standard make.
2. Are designed with ample conducting parts so that the temperature rise of no portion of the circuit breaker exceeds 30 degrees centigrade when operated at rated load.
3. Direct and alternating current breakers cover all voltages up to and including 1200 volts, single, double and triple pole.
Double pole breakers have each pole operated by a separate handle.
Triple pole breakers have all three poles operated by a single handle and include the "trip free" feature.
- The above breakers are furnished to operate on overload, low voltage, overvoltage and shunt trip or any combination of the above. In addition direct current breakers are furnished for underload or reverse current.
4. Auxiliary switches can be applied to any of the breakers without alteration; for use in ringing bells, lighting lamps, tripping other breakers, etc.
5. Low voltage and shunt trip attachments can also be applied to any of the circuit breakers after they are installed without any change in the circuit breaker.
6. Generally require less space on switchboards than other standard types.
7. Take less power to close than other makes.
8. Studs and contact blocks are drop-forged in one piece in all but the smallest sizes.
9. The carbon secondary contacts are made of solid blocks of selected carbon, securely fastened by clamping jaws, without the use of screws, which require grooves or holes in the carbon tending to cause breakage.
10. Carbon arcing tips are given a sliding motion under pressure on each other in closing, thus insuring a good contact.
11. The main brush contact is effectively protected from burning by a properly located burning tip.
12. A special form of laminated brush is used for making the main contact. It gives the laminations an end-on contact with the contact blocks and allows a heavy pressure to be placed upon and uniformly distributed over its entire contact surface. There is no tendency to force any part of the brush out of contact, which results in maximum efficiency.
13. A special arrangement is provided for making adjustment of the pressure of the contact brush.
14. The brush meets the contact block with a decided wiping motion, thus cleaning the area of the contact at each operation.
15. The breakers are all held closed by a positive lock which cannot jar loose.
16. All these breakers trip easily without the use of auxiliary accelerating devices, such as springs or weighted handles.
17. The manual tripping device is well insulated from the live parts of the circuit breaker.
18. Each circuit breaker is calibrated individually.
19. The calibration is marked with white numerals on a black background and shows up distinctly.
20. The range of calibration extends from approximately 50 per cent. to 150 per cent. or more of the rated ampere capacity.
21. All circuit breakers are given a high potential test of at least five times their rated voltage.
22. All parts of circuit breakers likely to require replacement are made renewable and repair parts are carried in stock.
23. These circuit breakers have been submitted to exhaustive tests with regard to their rupturing capacity and their mechanical construction. In all cases they have proven eminently satisfactory.
24. These breakers can be removed from the shipping template, or from one panel to another without disturbing the adjustment.
25. Designed by engineers who are largely instrumental in developing reliable circuit interrupting apparatus.
26. Life tests on all lines of breakers eliminate weak points in mechanical construction.

DIRECTIONS FOR ORDERING

Attention to following will avoid errors and delays in shipment.

Always give Mfr. No. if listed.

Direct current or alternating current. If alternating current, state frequency.

Voltage.

Rated ampere capacity (maximum load if less).

Overload, underload or plain shunt trip.

Single, double or triple pole.

Front or back connected. Thickness of panel.

Number of overload coils.

Kind of service { Lighting
Power
Railway

Attachments, if any, giving Mfr. No. of each.

Complete shipping instructions—freight or express.

In case Mfr. Nos. are not listed covering exact requirements order should read, "Circuit Breaker(s) similar to Mfr. No. . . .," followed by concise description of combination or operation required.

In ordering repair parts give serial No. of breaker and name of part by reference to Lists of Parts.

Protective Apparatus and Switchboard Accessories 15

G. E. CIRCUIT BREAKERS

Automatic Circuit Breakers (Overload)

CARBON BREAK, TYPE C, FORM Q, DIRECT AND ALTERNATING CURRENT

Direct Current, Type C, Form
Q Overload Circuit Breaker

The Type C, Form Q circuit breaker has been designed to meet the demand for a compact, single pole breaker of low price, for the automatic protection of small capacity motor, lighting and heating circuits and similar service.

It is made in the front-connected, single pole form only, for use on direct current and alternating current circuits of 250 volts or less, and is mounted on a natural black slate base $8\frac{1}{2}$ inches long, $2\frac{3}{4}$ inches wide and $\frac{3}{4}$ inch thick.

These circuit breakers are quick-acting, of rugged construction and the temperature rise will not exceed 28 degrees C. at rated full load current. The main contacts are of the laminated brush type. Heavy carbon secondary contacts on suitable spring supports are provided to prevent injury to the main contacts. The secondary contacts may be easily replaced when necessary. Two cable terminals are furnished with each circuit breaker.

The tripping mechanism consists of a plunger actuated by a series coil and arranged to deliver a "hammer blow" to the latch which holds the breaker closed. Once the plunger commences to move, the pull continually increases and the tripping action is therefore absolutely positive. An insulated button is provided on the latch for hand operation, and this latch, as well as the catch, are of hardened steel.

The calibrating device is insulated from the live metal parts of the breaker and is locked in position. To adjust the tripping point, loosen the calibrating arm by giving the handle a half turn to the left, then raise or lower the arm until the proper line on the scale appears opposite the line on the name plate. Lock the calibrating arm in position by giving the handle a half turn to the right.

All live metal parts have bright copper finish, insulated parts, black oxidized.

These breakers will stand a high potential test between circuit breaker and ground of about five times their normal voltage rating.

Type C, Form Q, Carbon Break—Direct and Alternating Current Overload, 250 Volts

Double Pole, 500 Volts

Manufacturers' No., list prices, etc., same as above.

*Each pole mounted on separate base.

†Combination consists of one single pole overload and one single pole underload breaker. When used as single pole breaker, both breakers are connected in series. When used as double pole breaker, connect overload breaker in one side of line, underload in the other side.

Direct Current—Combined Overload and †Low Voltage

Single Pole, 500 Volts or Less—Front Connected
on 1½ Inch Base

Single Pole, 500 Volts or Less—Back
Connected for 1½ or 2 Inch Panel

*Release at one-half rated load.

†Should be allowed to remain in circuit only momentarily.

Same attachments with either single or double pole breakers.

Only one pole (the right hand from the front) is tripped out by these attachments.

††Mfr. No. and list price includes circuit opening auxiliary switch for opening shunt coil circuit.

Delivery F. O. B. Factory, Schenectady, N. Y. For warehouse deliveries, write nearest house.

G. E. CIRCUIT BREAKERS

Single Pole, Overload, 650 Volts, 500 Amperes

Double Pole, Overload, 250 Volts, 1200 Amperes

Type C, Form P, Carbon Break

BACK CONNECTED DIRECT CURRENT—OVERLOAD

Recommended for general switchboard work. Main contact brushes are protected by carbon and metal secondaries. Contact pressure adjustable. Each breaker calibrated individually and has wide range of calibration, clearly marked. Double pole breakers, each pole separate handle; triple pole breakers, one handle for all poles and "trip-free" feature. Contact studs and blocks drop forged in one piece.

Single Pole—650 Volts or Less

NUTS AND TERMINALS

List prices include complete equipment of nuts and terminals for each stud.

*Load which the breaker will carry continuously at 30 degrees C. rise or less.

†Mounted on 1½ inch base.

†Releases at approximately one-half rated voltage.

††Include series resistance for low voltage coil.

Delivery F. O. B. Factory, Schenectady, N. Y. For warehouse deliveries write nearest house.

G. E. CIRCUIT BREAKERS

S. P.—500 Amperes, 650 Volts—Reverse Current
Direct Current—††Reverse Current—Back Connected

Generally used for protecting generators, storage batteries and like service.

Reverse current feature does not operate on overload. Potential coil only in circuit while breaker is being closed, requires no exciting current in normal operation.

Is independent of voltage in operation and, consequently, not affected by low voltage conditions.

Single Pole—650 Volts or Less
Double Pole—250 Volts

*Load which the breaker will carry continuously at 30 degrees C. rise or less.

†This combination includes a shunt trip circuit breaker, circuit opening auxiliary switch and Type B Form C-25 inverse time limit series overload relay (circuit closing). The relay is separate from the circuit breaker and electrically connected with it, consequently it may be mounted apart from the breaker in any convenient location. Time limit feature adjustable from instantaneous operation to thirty seconds delay.

‡IMPORTANT: When used on 125 volts or less, and also on 650 volts or less when the shunt trip coil is connected so that the trip coil circuit is opened when the circuit breaker opens, the auxiliary switch will be omitted if so ordered. If omitted, deduct \$6.00 from the list price.

G. E. CIRCUIT BREAKERS

Circuit Closing Switch

**Combined Circuit Closing
and Circuit Opening Switch**

Circuit Opening Switch

**Type C, Form P, Carbon Break—Attachments
Alternating and Direct Current**

Shunt trip and low voltage release attachments where mounted on a standard multiple breaker trip out all poles.

Shunt trip should be connected in circuit only momentarily.

Low voltages can be connected in circuit continuously. Always specify voltage so proper resistance can be supplied. Low voltage releases at approximately one-half voltage.

G. E. CIRCUIT BREAKERS

Type C, Form K & K-2 Carbon Break Circuit Breakers

General

CK rated 250 volts.

CK-2 rated 650 volts.

Standard capacities from 1500 to 6000 amperes D.C.; 1500 to 3000 amperes A.C. inclusive. Higher capacities made on order only.

Single and double pole, back connected CK recommended for heavy service where large capacity breakers are required for power or lighting installations.

CK-2 recommended any service however severe and especially adapted to large railway installations having highly inductive loads.

Include nuts but no terminals.

Can be furnished with spade handles and laminated studs.

Shunt trip and low voltage attachment standard for D.C. only.

Type C, Form K, 2000 Amperes, 250 Volts

Type C, Form K, Carbon Break

Back Connected

DIRECT AND ALTERNATING CURRENT

Features

1. Can be furnished from stock in capacities from 2000 to 10,000 amperes. Breakers for 1500 and 14,000 amperes can be furnished made up on order.
2. Are designed with ample conducting parts.
3. Complete line of attachments at low price.
4. Require small amount of space on panel.
5. Close easily.
6. Studs and contact blocks drop forged in one piece.
7. Very heavy and substantial carbon secondaries.
8. "End on" contact construction of main brush, being largely copied by competing manufacturers.
9. Heavy brush pressure, high efficiency contact and means of adjusting pressure.
10. Wiping contact, both main brush and secondaries.
11. Trip easily but cannot jar open.
12. Handle and tripping button well insulated from live parts of breaker.
13. Each breaker calibrated individually. Wide range of calibration.
14. Life tests to eliminate weak parts, actual load tests up to 64,000 amperes.

G. E. CIRCUIT BREAKER ATTACHMENTS

Nuts and Terminals

Type C, Form K, Carbon Break—Direct and Alternating Current Attachments

Nuts and Terminals

A complete set of nuts for each stud is furnished in accordance with standard practice. Terminals are not included with the circuit breaker, as in many cases bus bar connections are used. Where terminals are required, the size and quantity of cable connections vary so widely, depending on the length of run, the line drop allowed and other conditions, that it seems preferable to list them separately so that proper selection may be made to suit each case.

G. E. OIL BREAK SWITCHES

Type F, Form P3 Oil Break Switch

Cutout

Type F, Form P6 Oil Break Switch

Types F, Forms P3 and P6 Oil Switches

Type F, Forms P3 and P6 are designed specially for use in industrial plants in connection with induction motors of capacities not in excess of 25 horse power at 600 volts, or with normal current ratings not greater than 50 amperes at voltages less than 600. They are arranged for mounting directly on a wall, post, or where used with spinning frames in textile mills on the frame itself. When mounted on the spinning frame the switch is operated by a shipper rod. The live parts being entirely enclosed, the switches are particularly suitable for use in factories in which the air contains inflammable particles, or where explosive materials are prevalent.

The Type F, Form P3 Oil Switch is made non-automatic only.

The Type F, Form P6 Oil Switch is made automatic only. In the main these switches are similar and differ only in a few details.

Capacities. These switches are made in the following capacities:

Type F, Form P3 non-automatic 600 volts, 50 amperes triple pole and four pole, single throw.

Type F, Form P6 automatic 600 volts, 50 amperes, triple pole, single throw.

Type F, Form P3 Oil Break Switches FOR WALL MOUNTING (SPINNING FRAMES, MACHINE TOOLS, ETC.)

Non-automatic (Quick Make and Quick Break)

Accessories and Switchboard Accessories 35

G. E. OIL BREAK SWITCHES

**Type F Form P-10 Oil Switch, 30 Amp., 600 Volt
T.-P. S.-T. Automatic with Two Series I T L Overload Trip Coils**

Type F Form P-10 Oil Switches

30 Ampere 600 Volts or Less

FOR INDUCTION MOTORS OF 10 H.P. OR LESS

These switches are especially adapted for the protection of small induction motors which can be thrown directly onto the line.

The Type F form P-10 switches are listed triple pole, single throw non-automatic. Automatic with double series inverse time limit overload trip; and plain low-voltage switches.

These switches are small, compact and inexpensive. Mechanical and electrical features are not surpassed by switches of larger size for motor protection. Although made largely from punchings, all parts are rugged and substantial, ensuring long life under severe operating conditions. All live parts are totally enclosed. Frame, oil vessels and calibrating features are practically dustproof. The frame is provided with a lug to take a padlock by which the switch may be locked in the open position.

Automatic switches trip free from handle and cannot be held on overload or short circuit or left in an intermediate position. The handle follows the operation of the switch and the position of the switch contacts is indicated by on and off stamped on the frame. The frame is arranged for mounting on any flat surface or bracket and is held rigidly by two bolts.

The contact parts are insulated from ground and between phases by porcelain insulation, giving a higher factor of safety and are constructed as a unit so that they may be removed easily from the frame or replaced. The switch is double-break, opening by gravity with speed augmented by springs on the mechanism. Contact fingers of the well-known K types are so constructed that the burning occurs on a surface other than that used for contacting when the switch is in the closed position.

The mechanism is simple in construction. All parts held by lock washers, they are practically all made from dies so that they are accurately interchangeable and repair parts can be easily installed. The switch frame is arranged to take either open or conduit wiring at right hand end of switch.

Automatic switches have series trip coils from 2 to 30 amperes and calibrating from normal to two times normal. These coils are assembled in pairs in a single piece, magnet frame complete with calibrating tubes and time limit features. These units are interchangeable for coils of all ratings. All coils are calibrated individually.

G. E. OIL BREAK SWITCHES

Non-automatic Triple Pole, Single Throw
Switch on Panel

Automatic Triple Pole, Double Throw
Switch on Panel Pipes

Type F, Form K-13 Switches

Type F, Form K-13 oil switches are intended primarily for use in small and isolated alternating current plants having voltages not greater than 3300, and for generating stations and substations coming under the classifications given below.

The use of the Form K-13 oil switch on circuits of 751 to 3300 volts, inclusive, is subject to the following limitations irrespective of the "bus capacity" of the station:

1. It is not to be used for railway service.
2. It is not to be used anywhere on a system the maximum generating capacity of which exceeds 20,000 kv-a. (except as outlined in clause 6) or on any system in districts subject to severe lightning disturbances.
3. It is not to be used anywhere in a generating station of which maximum capacity exceeds 2800 kv-a.
4. For systems of 2600 to 5000 kv-a. maximum generating capacity it may be used in substations providing a higher duty switch is interposed between it and the main station bus.
5. For systems of 5000 to 20,000 kv-a. maximum generating capacity, it may be used only under the following conditions:

(a) In a substation providing transformer capacity not exceeding 750 kv-a. is interposed between the Form K-13 switch and the line.

(b) On a substation feeder providing a higher duty switch is interposed between the Form K-13 switch and the substation bus.

6. When considering switches for connection to busses fed from the low voltage units of motor-generator sets, the capacity of the system supplying energy to the motor-generator sets need not be considered. In such cases the sum of the rated capacities of the generator units of the motor-generator sets must come within the limits given in the above table to allow the use of K-13 switches.

Classes and Capacity. They are made double, triple and four pole, single and double throw, with a normal current rating of 200 amperes, and may be non-automatic, automatic with one overload coil, automatic with two overload coils.

Calibration. When relays are used with automatic oil switches, the trip coil of the switch should be set at its minimum point of calibration, and the relay at the point corresponding to the overload at which the switch is desired to operate. Both relay coils and switch trip coils (except middle tap coils) for use with current transformers are calibrated for 5, 7 and 9 amperes secondary current, which values multiplied by the ratio of the current transformer used give the corresponding primary currents. The graduations on the calibrating tubes of switches actuated by series trip coils represent actual current values.

CONSTRUCTION

Each Type F, Form K-13 switch is a self-contained unit with bushings, studs, contacts, mechanism and oil vessels, all supported from one frame.

Contacts. The switch opens downward in oil. The movable contacts for each pole consist of two copper half blades fastened together to form a single wedge-shaped blade.

The stationary contacts consist of flared fingers of drop forged copper secured to the lower rectangular part of the copper studs by flat steel springs and copper laminations. This is the well-known K type construction, which years of actual operating experience have proved to be the best known form of contact for oil switches. With this construction a distinct rubbing movement is imparted to the contact surfaces in opening and closing which insures not only clean contact surfaces at all times, but also perfect contact over the entire contact surfaces.

In opening the circuit the current is ruptured between the flared portion of the stationary contact fingers and the upper extremity of the movable contact blade, thus protecting the working contact surfaces from the damaging effects of the arc. Contact fingers and blades can be easily replaced when necessary.

Oil. For oil switches we recommend the specially treated switch oil No. 6. This is prepared by a special process, has a high flash point, and strongly resists carbonisation.

G. E. OIL BREAK SWITCHES

Type F, Form K-13 Oil Break Switches

LOW-VOLTAGE RELEASE ATTACHMENTS

A complete line of new low-voltage release attachments is listed below for voltages up to and including 550 volts. Above 550 volts, use 110 volt attachment with series resistance in secondary of a voltage or potential transformer.

Plain Low-voltage Operating Levers

The attachments listed are for use with automatic operating levers. Where no overload features are required the left-hand low-voltage attachment for single throw, one coil lever may be used with a special, plain, low-voltage operating lever provided with a tripping toggle for the low-voltage attachment, but otherwise similar to non-automatic mechanism. Plain low-voltage switches are not listed but prices may be obtained by adding the list price of left hand, low-voltage attachment and transformer, if required, to the list price of a non-automatic (single throw) switch and substituting the plain low-voltage operating lever at the extra list price as per the following table:

For Substituting Plain Low-voltage Operating Levers

List No.	For Switch Mounted	*Add to List Price Non-Automatic, Single Throw Switch
301878	On Panel.....	\$8.80
301879	On Panel Pipe.....	8.80
301880	Remote Control.....	8.80

*Double throw switches are usually automatic and would use standard low-voltage attachments as listed. Plain low-voltage, double throw switches will require special consideration. Prices on request.

*Low-voltage Release Attachments

25-60 CYCLES

For Single Throw Switch—One Coil Operating Lever Also Plain Low-voltage Operating Lever (Left Hand Only)

G. E. OIL BREAK SWITCHES

Triple Pole, Single Throw, K-5 Automatic Oil Break Switch Remote Control

Triple Pole, Single Throw, K-5 Automatic Oil Break Switch Mounted on Panel Pipe Supports

Oil Break Switches for 600, 4500 and 7500 Volt Alternating Current Service

TYPE F, FORM K-5

The Type F, Form K-5 oil break switch is a thoroughly reliable switch of moderate rupturing capacity for use on alternating current circuits up to 7500 volts.

It is the result of years of study and experience in the design, manufacture and use of oil break switches, and contains every essential for long and reliable service. It is liberally designed and conservatively rated, simple in construction and operation, made of the best materials, and is economical in initial cost, cost of installation and cost of upkeep.

The arc incident to opening the circuit is confined in the oil vessel under oil and cannot involve adjacent apparatus. The circuit is ruptured at the zero point of the wave, reducing to a minimum the possibility of a surge occurring on the line.

Capacities

This switch is made in the following capacities:

600 volt, 300 and 500 amperes, double, triple and four pole, single and double throw. 800 ampere single throw only.

4500 volt, 200 amperes, double, triple and four pole, single and double throw.

7500 volt, 300 and 500 amperes, single, double, triple and four pole, single and double throw.

The double throw switch consists of two single throw units with a common frame and oil vessel. The operating levers are equipped with a simple and positive mechanical interlock so arranged that one switch only can be closed at a time.

Types

The Type F, Form K-5 oil break switches can be furnished as follows:

Non-automatic—Without overload release.

Automatic—With overload release, with trip coils for connecting to the secondaries of current transformers, up to 7500 volts; or with trip coils for connecting directly in series with the main circuit, up to 2500 volts.

Oil

For oil break switches we recommend No. 6 transil oil, which is prepared by a special process and is of superior quality because of its resistance to carbonizing and its high flash point.

Hand-operated Switches Include

Switch complete with oil, cable terminals and insulating sleeves,

Operating mechanism except pipe connecting rods,

Current transformers (for automatic current transformer trip switches only).

Solenoid-operated Switches

Solenoid-operating mechanisms can be furnished for operating any of the K-5 switches. These consist of the ordinary closing and opening solenoids wound for 125, 250 or 600 volts direct current, and are operated by suitable control switches and relays.

*When ordering, specify ampere capacity of series coils required for each switch.

†Load which the switch will carry continuously at 28 degrees C. rise or less.

‡For use only with circuit closing relays and separately energized trip coils.

Delivery F. O. B. Factory, Schenectady, N. Y. For warehouse deliveries write nearest house.

†Load which the switch will carry continuously at 30 degrees C. rise or less.
Switches for 2500 volt service only. We do not recommend the installation of apparatus on the panel or switchboard when that apparatus is subjected to a potential in excess of 2500 volts. For such installations remote control apparatus is recommended.

G. E. DIRECT AND ALTERNATING CURRENT RELAYS

GENERAL

No. 102720

Type P, Form F, Instantaneous Overload Circuit Closing Relay

No. 102721

with Cover

No. 102722

The connections between the relays and circuit-opening devices are usually electrical. Combinations of this nature are extremely flexible, since they admit of the use of a number of devices, each having a different function, with a single oil switch or circuit breaker as well as with two or more switches to secure the desired operation or protection. Such combinations are positive in operation and may be easily installed to fulfill requirements which would be impracticable with mechanical devices applied directly to the oil switch or circuit breaker.

All relays should be regularly inspected and carefully cleaned and they should be occasionally tested in order to insure the most satisfactory operation.

Relays for both alternating and direct current are similar in their chief characteristics and may be classified

under two main headings, namely: "Circuit-closing" and "Circuit-opening."

The function of a circuit-closing relay is to close an electrical circuit, usually direct current, through a trip coil on an oil switch or circuit breaker, or it may short-circuit a low voltage release coil, and thereby open the oil switch or circuit breaker on occurrence of the condition upon which the relay is designed to operate.

Circuit-closing (normally open) relays are supplied with carbon contacts. These contacts will open 10 amperes at 125 volts.

The function of a circuit-opening relay is to open an electrical circuit, usually alternating current, and thereby cause the oil switch or circuit breaker to be opened by the use of trip coils in the secondary of current transformers, or by low voltage release coils.

When in the normal position the relay contacts are in multiple with the oil switch or circuit breaker trip coils, or in series with a low voltage release coil. When the relay operates, the current from the energizing circuit flows through the trip coils and trips the switch or break; or, if a low voltage coil is used, the lifting of the contacts opens the energizing circuit and causes the oil switch or circuit breaker to open.

Circuit-closing relays with three contacts are for tripping two switches from one relay where the trip coils cannot be connected together permanently.

No. 102723

Type P, Form F-2, Instantaneous Overload Circuit Opening

No. 102724

Cover Removed

No. 102725

Circuit-opening relays are used chiefly in those cases where direct current for the tripping circuit is not available.

Alternating current trip coils have relatively high impedance and impose a heavy volt-ampere load on the current transformers. To reduce this load during normal operation the circuit-opening relay is frequently used and is usually necessary where instruments and meters are to be operated on the same current transformers as the trip coils if the greatest accuracy is required.

The relay contacts in the normal, closed position short-circuit the trip coil. When the relay operates on overload or other abnormal condition the contacts are opened with a quick break, sending the current through the trip coil current momentarily and tripping the switch. With circuit-opening relays

the trip coils of the oil switch must be set to trip somewhat lower than the setting of the relay.

Double pole circuit-opening relays have the contacts of each pole separate, so that each pole can be operated independently.

Circuit-opening relays are equipped with quick break contacts, which open independently of the time of travel of the plunger.

Terminal boards are furnished with most of the relays described. These are numbered and lettered to correspond to the terminals of the relay coils, and greatly facilitate proper installation.

Instantaneous relays are equipped with glass covers, time limit relays with metal covers, except when otherwise noted. These covers are supported by the magnet frame, and keep the contacts free from dust and dirt. Relays such as the series overload type do not require covers.

Relays have all exposed current-carrying parts polished and lacquered. Frames and metal covers are finished dull black and compare with other switchboard devices in their neat and attractive appearance.

G. E. RELAYS

No. 102729 No. 102730 No. 102731
Type P, Form G, Inverse Time-Limit Overload Circuit-Closing Relay, with Cover

**A.C. Overload
TIME ELEMENT**

Circuit-closing and circuit-opening relays are further subdivided into instantaneous and time-limit. Instantaneous relays operate almost instantly on the half second to about 30 seconds delay depending on the time setting and the magnitude of the overload current. A setting of from two to six seconds is ordinarily used, depending upon requirements; where selective operation is desired a minimum setting of two seconds is recommended.

Under conditions of overload or short circuit the inverse time-limit relay operates in inverse ratio to the strength of the current. Therefore, the heavier the overload or short circuit the more rapidly the relay will operate.

***For Use with Current Transformers Having 5 Ampere Secondaries
Instantaneous—Overload**

G. E. RELAYS

Type R, Form B-2

Type R, Form B-3

Direct Current Reverse Current Relays
Type R, Form B-2

The Type R, Form B-2 Reverse Current Relay is designed for mounting on circuit breaker studs. It consists of a horseshoe magnet with a shunt wound armature pivoted between its poles. The magnet is mounted on the current-carrying stud of the circuit breaker between the back of the panel and the first contact or supporting nut, and is placed in a vertical position.

The contacts are insulated from the magnet, permitting the use of an auxiliary circuit for the tripping device, independent of the circuit controlled by the circuit breaker. This is highly desirable on 600 volt systems where a reliable low voltage auxiliary source is available.

Type R, Form B-3

These relays are for the same purpose and perform the same functions as the Type R, Form B-2, Reverse Current Relays, and they are similar in their method of operation.

Being for smaller capacity service, a coil instead of the stud is used to furnish a field for the armature.

G. E. RELAYS

Type P, Form F10
Circuit ClosingType P, Form B10
Solenoid Control Relay

Alternating Current Relays—Low Voltage

INSTANTANEOUS—TYPE P, FORM F10 CIRCUIT-CLOSING TWO CONTACT 600 VOLTS OR LESS FOR MOUNTING ON FRONT OF PANEL

The contacts of this relay are similar to those of circuit-closing overload relays except that they are inverted. These relays are connected directly across the line with proper resistance in series with the relay coil. As long as the potential is normal the contact cone is held above the contacts. When the potential falls below one-half normal the cone and plunger rod drop and close the contact. This relay does not pick up its own plunger. The plunger rod is pushed up by hand after the potential circuit is established. Low-voltage relays are generally used in connection with a low-voltage release or shunt trip coil on an oil switch or a circuit breaker. They are used in connection with motor-booster sets to prevent a disastrous speed of the booster which might result from the loss of alternating current power. They are also sometimes used for indicating purposes.

Solenoid Control Relays—Circuit Closing

TYPE P, FORM B10—SINGLE POLE—DIRECT CURRENT—125 to 600 VOLTS

For Use with Solenoid Operated Oil Break Switches (No Covers)

Relays with copper contacts are designed for opening control circuits of 30 amperes and under. They are suitable for use with Type F, Forms K3 and K12 oil break switches and carbon break circuit breakers. Carbon contact relays are designed for opening control circuits of 30 to 100 amperes. They are for use with solenoid operated Type F, Form K10 oil break switches. Copper contact relays with two contacts are used where it is desired to control two solenoid operated switches, each independent of the other, from one relay.

WESTINGHOUSE LIGHTNING ARRESTER

Type A Electrolytic Arrestor

Type B Arrestor

Type A Electrolytic Lightning Arresters

Up to 1500 Volts Direct Current—For Station Use

Application. Where an extremely low equivalent lightning arrester is required. Experience has shown that lightning discharges or rise of potential of any kind will pass freely through these arresters. The equivalent spark gap as commonly measured is practically zero.

Principle. The arrester depends for its operation on the peculiar properties of a film deposited electrolytically on aluminum trays.

Construction. The arrester consists of a tank of oil in which are placed, on properly insulated supports, a nest of cup-shaped aluminum trays. The spaces between the trays are filled with electrolyte, a sufficient quantity for one charge being furnished with each arrester. The top tray is connected with the line through a 60 ampere fuse, and the bottom tray is connected to the tank which is thoroughly grounded by means of a lug. The fuse is of the enclosed type and mounted on the cover of the arrester.

A small charging current flows through the trays continuously and keeps the films on the trays built up, so that no charging is required. This charging current is not, however, of sufficient value to raise the temperature appreciably.

.....	Type D electrolyte (per 5 gallon can).....	5.94

Type B Lightning Arrester

Up to 1500 Volts—Direct Current—For Car or Line Use

Application. The type B arrester is for line protection and is arranged particularly for pole mounting. It can be used on potentials up to 1500 volts, being tested before shipment at 6000 volts.

Construction. The arrester is divided into two parts, hinged together. The parts are so arranged that when the lower half is let down the line circuit is opened to the arrester, leaving all active parts dead. The spark gap can then be adjusted if desired and all parts inspected without danger. The spark gap is composed of diverging fingers so that the arc lengthens as it is blown out. The entire apparatus is supported by a galvanized iron bracket. The high insulation test required made it preferable to build this arrester in the form of a larger unit than usual. In this way a very free discharge and powerful blow-out have been obtained.

The ruggedness and discharge characteristics of this lightning arrester make it the equal, for the same service, of at least two other arresters for similar service.

WESTINGHOUSE LIGHTNING ARRESTERS

Two-Pole Type G

Three-Pole Type G

Indoor Type W

Outdoor Type W

Type G Lightning Arresters

For Alternating Current Light and Power Circuits, not exceeding 2500 Volts

The principle of operation of the Type G arrester is somewhat similar to that of the Type C arrester. A series of gaps between non-arcing metal cylinders arranged in a row, is connected between line and ground in series with a composition stick resistor having a resistance of something between 80 and 120 ohms. If an excessive potential is developed on a line protected with a Type G arrester, electric discharge arcs form between the metal cylinders, and the charge of electricity flows to the ground, relieving the excessive stress. The resistance of the stick resistor limits the flow so that an excessive power current cannot pass through the arrester. The tendency for a destructive power arc to follow the discharge arc is thus counteracted.

The composition resistors and the gap cylinders are mounted in pairs on a porcelain base, and complete units are arranged within weatherproof wooden boxes. For two-pole arresters, one unit is mounted on the back of the box. For three-pole and four-pole arresters, two units are used; one is secured on each side of the box. In the three-pole style, one of the resistor rods and its clips is omitted from one of the units.

Type G arresters may be installed out-of-doors on poles or buildings, or indoors on station walls. The weatherproof wooden case effectively protects the arrester units from rain and snow when they are installed in exposed locations.

Type G arresters are designed for the protection of alternating current circuits, operating at voltages not exceeding 2500. Type G arresters do not offer as great a degree of protection as do Type S arresters, but may be applied to circuits served by sources capable of developing any amount of power.

98062A	Resistance Rod		0.5	2	2.16

Type W Lightning Arresters

6600 AND 13,200 VOLTS

Capacity. Type W arresters are built as 6600 volt units and can be used on lines of any kilowatt capacity. For 13,200 volt circuits, two arresters are used in series.

Application. These arresters are used as single pole arresters on single phase, two-phase and three-phase lines. They are particularly convenient to install on poles as no mounting is required, the arrester being simply hung from the line wire or crossarm. Where two arresters are used, on 13,200 volts, the two are hooked together and the proper electrical connection made.

Construction. The arrester consists of a number of small spark gaps between caps of non-arcing metal, in series with a suitable resistance. The non-arcing metal caps are supported on an insulated rod and separated by porcelain spacers. The lowest metal cap is connected to a resistance rod enclosed in a mica tube. The whole is suspended from a porcelain insulator and provided with a hook at the lower end for making fast or suspending another arrester.

Outdoor Arresters. For outdoor use a metal hood is provided to shed water and snow from the spark caps.

WESTINGHOUSE LIGHTNING ARRESTERS

Indoor, No. 16602

Outdoor, No. 201601

Low-Equivalent Lightning Arresters

For 2500 to 50,000 Volts

Low equivalent lightning arresters may be used on circuits of unlimited capacity, and they afford a degree of protection second only to the electrolytic arresters. They may be used in preference to the electrolytic arresters in stations of small to moderate capacity in localities where lightning conditions are not very severe. They should always be used for the protection of isolated substations where the attention required by an electrolytic arrester cannot be given.

Disconnecting Switches. It is recommended that a switch be supplied with each arrester in order to easily disconnect it from the line when desired.

Construction. The arrester consists of three parts: A number of gap units in series, a number of gap units in shunt with a resistor, and a series resistor. These three parts are connected in series from the line to the ground in the order given. All resistors are non-inductive. The resistors and gap units are mounted on marble.

Operation. When a discharge occurs the series gaps are broken down, and if the discharge is heavy enough, it will meet opposition in the shunt resistance and pass over the shunted gaps, through the series resistance to the ground. The arc that tends to follow the discharge is then withdrawn from the shunted gaps by the shunt resistance and, opposed by both resistances, is suppressed by the series gaps. The potential at which a discharge takes place is determined by the number of series gaps; a sufficient number are used to withstand the normal voltage and yet give a proper factor of safety for the severest service.

These low equivalent arresters are therefore non-arcing under all conditions and at the same time prevent a dangerous rise of potential on the line by offering an easy passage to the ground for lightning or other static discharges. They are single pole, one arrester being required for each line to be protected.

Outdoor Arrester. For outdoor use the low equivalent arresters are listed enclosed in wooden cases with hinged door.

List No. and list price include arrester complete mounted on a marble panel and supplied with series and shunt resistance and insulators when necessary.

WESTINGHOUSE LIGHTNING ARRESTERS

Type No. 47417A
For Car Mounting

Type 154297
For Pole Mounting

No. 138891
For Conduit Wiring

Type MP Arrester

For Street Railway Service—A.C. and D.C. Circuits—Single Pole

By the method of construction employed a lightning arrester has been produced which has an indefinite length of life, and which affords a freedom of discharge many times greater than any of the low voltage lightning arresters now on the market.

The MP Lightning Arrester takes its name from the fact that the static discharge spreads itself over the surface of a block of special composition along a number of minute discharge paths—multipath—hence the name MP. The voltage across each gap is very small, but owing to the large number of gaps the line voltage cannot maintain an arc across them.

This arrester may be used on each car, on the line or in the power house.

It is furnished with a weatherproof galvanized iron case and is neat and compact in design.

Construction. For installation under different conditions, three different styles of Type MP Arrester are furnished. In all three the live parts are mounted in substantial galvanized iron boxes, the covers of which close against felt gaskets, and are held by rugged spring-toggle latches.

No. 47417A for car mounting is constructed with the mounting lug on the top casting and when the bottom casting is removed the working part comes out with it. It is therefore convenient for mounting under car sills and in other inaccessible places. It is weatherproof.

No. 154297 for pole mounting is the same as Style No. 47417A except that the mounting lug is located at the bottom, so that the cover can be removed for inspection without dropping out the live part.

No. 138891 for conduit wiring is mounted in a larger box having a conduit hole tapped with a standard $\frac{3}{8}$ inch pipe thread. The ground lead is connected directly to the box, and the conduit system should be grounded.

WESTINGHOUSE LIGHTNING ARRESTERS

Type C, Double Pole, Alternating Current Arresters

This lightning arrester consists of seven cylinders of non-arcing metal mounted on a porcelain base, which is incased in a weatherproof iron box. Leads are brought out from the first, last and middle cylinders. For circuits with normal potential not exceeding 1250 volts the arrester will afford protection for both sides of a two-wire circuit. For circuits exceeding 1250 volts, but not exceeding 2500, one of the outside leads is grounded, the other is connected to the line and the middle lead is disconnected. In this case it is used as a single pole arrester.

The Type C Lightning Arrester should be used on circuits of a capacity not exceeding 200 kilowatts, within a radius of 2 miles of the source of power. An additional 100 kilowatts of capacity is permissible for each additional mile. About five arresters per mile are recommended for this service. For all capacities beyond the limits given for the Type C Lightning Arrester, the Type S Lightning Arresters should be used.

List No.	Circuit Voltage	List Price Each
62133A	500 to 2500 A.C.	\$5.58
48231	Unit for Type C Arrester.	3.42

Type CR, Alternating Current Arresters

The Type CR Arresters are used on alternating current circuits of any frequency or capacity and of voltages up to 2500. They may be installed out-of-doors on poles or buildings or indoors on station walls. The weatherproof metal case effectively protects the arrester units from rain or snow when installed in exposed locations.

It is recommended that one set of the Type CR Arresters be installed at each distributing transformer, with a maximum of five sets of arresters to the mile of line.

The Type CR is similar to the Type C with a resistor in series with the non-arcing spark gaps. This resistor prevents the power arc that might occur with the Type C Arrester if used on circuits of high capacity. The resistance is low enough to give good protection but high enough to insure reliable operation and to enable the non-arcing metal gaps to quench the arc at the end of the first half-cycle. The discharge voltage is as low as is practical for use on the circuits for which the arrester is rated.

The distinctive features of the Type CR Arrester are: Unlimited capacity, non-arcing metal spark gaps, spark-gap cylinders can be turned in case of burning, "Koppat" resistor of new composition, absolutely unaffected in its resistance by static discharge, resistor and spark gaps self-contained in a weatherproof metal case.

Four cylinders and one resistance rod are mounted on a porcelain base in a metal case supplied with a cover and gasket to make the case weatherproof. The cover is attached to the case proper by a chain so that there is no danger of dropping it to the ground during inspection. The cover can be removed without danger of the inspector's coming in contact with live parts of the arrester.

WESTINGHOUSE LIGHTNING ARRESTERS

Mfr. No. 99426

Mfr. No. 99427

Mfr. No. 100728

Mfr. No. 100727

Type S Lightning Arresters

FOR 1200 TO 13,200 VOLTS

Capacities. The Type S Arresters are for use on circuits fed by generators or transformers of capacities up to 2000 kilowatts. For circuits of larger capacities the Type G or the low equivalent arresters are recommended. For stations of large capacity and voltages higher than 2200, however, especially where generators are to be protected, the Type A or AK Electrolytic Arresters are recommended as affording fuller protection.

Application. Type S Arresters are used as single pole arresters where the maximum voltage between lines does not exceed their rated voltage. They can be used on single phase, two-phase, or three-phase circuits.

They may also be used for the protection of circuits of 11,000 volts maximum, by connecting one 7000 volt arrester, mounted on a specially insulated base, to each line wire, connecting the ground leads of these arresters together, and connecting one standard 7000 volt arrester between this common connection and ground. For three-phase lines, four arresters are required, and for protecting both sides of a two-wire circuit three arresters are required.

Type S Arresters may be used on 13,200 volt lines having the neutral grounded by connecting in series two arresters, mounted on specially insulated bases, between each line and ground. For 13,200 volt lines with ungrounded neutral, eight arresters should be used, two on special bases connected in series from each line, and two in series from their common connection to ground. For 13,200 volt service, however, standard low equivalent arresters are to be preferred.

Type S Unenclosed Lightning Arresters Mfr. Nos. 100727 and 100728 designed for indoor service may also be used as safety spark gaps on the same voltages for which they are here listed as lightning arresters and with the same limitations as given above.

Construction. Type S Lightning Arresters are essentially small low equivalent arresters without a series resistance, and are made up of the units Mfr. No. 9587A listed on page 16, in connection with shunting resistance rods mounted on marble bases. For outdoor service they must be enclosed in weatherproof cases. The 3500 volt outdoor arresters are mounted in cast iron cases and the 7000 volt outdoor arresters in wooden cases. Both styles of cases have doors which permit inspection of the arresters.

Type S Arresters

List No.	Type	Circuit Voltage	Approximate Weight, Lbs.		List Price
			Net	Boxed

WESTINGHOUSE LIGHTNING ARRESTERS

No. 1811-A

Type I, D. C. Lightning Arrester

No. 46185

No. 4753

Type J, Direct Current, Single Pole Arrester

For Pole or Outdoor Use

Single Pole Line Lightning Arrester for D.C. Arc Lights

This arrester is similar to Mfr. No. 1810, listed below, but being for single arc circuit use is enclosed in an iron box.

List No.	List Price Each
1811A	Arrester, line voltage up to 4000 volts D.C. \$8.64

Type I Lightning Arrester

For Station Use—0 to 4000 Volts—Direct Current for Arc Circuits

The Type I Arrester is a single pole instrument and consists of two metal electrodes mounted upon a lignum vitae block, flush with its surface. Charred or carbonized grooves provide a ready path for the discharge, while a second block, fitting closely upon the first block, prevents gases or vapors from forming, and consequently no arc follows the discharge.

The arrester is mounted upon a marble base.

List No.	List Price Each
1810A	Arrester, single pole, voltage of circuit, up to 4000 volts D.C. \$8.38

Safety Spark Gaps

It is well known that with transformers, operating on high voltage lines with ungrounded neutral, and having large ratios of transformation, there may occur, on the low tension side, momentary voltages to ground, called "static disturbances," greatly in excess of the normal voltage. In general they are the result of a change in the static balance of the high tension side and its connecting circuits. Unless certain precautions are taken, such a static disturbance on the low tension side may cause serious stresses in the secondary insulation of a transformer with ratio of transformation more than 5 to 1, because the insulation of its secondary is less able to withstand them.

A method of relieving this disturbance is to connect a discharge spark gap between some point of the low tension side of the transformer to be protected (a middle or neutral point, if one is available) and the ground. The spark gap opening is such that any voltage very much in excess of the maximum normal will cause a discharge to ground, and thus the low tension side is practically tied to ground during such disturbance, while at other times it is ungrounded. It is the usual practice to ground the secondaries of low tension lines and spark gaps are not required in such cases.

The spark gaps Style Nos. 4753 and 46185 are designed for use on transformer secondary circuits and for protecting individual series arc lamps. These spark gaps are single pole, and consist of two cylinders of non-arcing metal with an air gap between. One of the cylinders is connected to ground, the other to the line.

Type S Unenclosed Lightning Arresters, Style Nos. 100727 and 100728, are used as safety spark gaps on the same voltages for which they are listed as lightning arresters and with the same limitations as given on preceding page for Type S Lightning Arresters.

Safety Spark Gaps

List No.	Type	Voltage of Circuit	List Price
46185	Outdoor	0-1100	\$2.16
4753	Indoor	0-1100	7.56
100727	Indoor	1100-3500	11.08
100728	Indoor	3500-7000	20.26

For voltages above 7000 a spark gap is not ordinarily used. Special recommendations will be made for such voltages.

Delivery F. O. B. Factory, Pittsburgh, Pa. For warehouse deliveries write nearest house.

WESTINGHOUSE LIGHTNING ARRESTERS

No. 2536 with Type MP Arrester

Type K, No. 186875

Type 6 Choke Coils

For Car Use—Direct Current

This choke coil when used should be inserted between the direct current line and the motor that is to be protected.

The choke coil consists of a number of turns of insulated wire or cable wound on a wooden core. One end is connected to the line and the other end to the motor. The trolley end of the coil is connected through a multiple spark gap lightning arrester to ground. Sudden rise of potential is prevented by the coil from entering the motor and escapes across the spark gap to ground.

A wooden core, List No. 167178, with end brackets and without winding is furnished where the customer wishes to make his own choke coil. This is done by simply winding the cable around the core and making the proper ground tap.

List No. and list price do not include lightning arrester. Ratings given are for a temperature rise of 25 degrees Centigrade.

List No.	Continuous Capacity Amperes	Approximate Weight, Lbs.		List Price
		Net	Boxed	
2536.....	65	16	30	\$12.96
3811.....	125	24	38	20.80
5612.....	200	26	40	22.96
3774.....	300	34	50	24.84
167178.....	Without Winding	12	26	1.90

The overall length of the choke coil is $25\frac{1}{4}$ inches, and its greatest diameter 5 inches.

Type K Lightning Arresters

Up to 1500 Volts Direct Current—For Line and Car Use

Application. The Type K arrester is for line and car protection on direct current circuits of 750 and 1500 volts.

Principle. The arrester is of the condenser type with a spark gap to insulate the condenser from the line when no disturbance is passing. The condenser is shunted by a high resistance which serves to keep the condenser discharged, so that its full capacity may be always available. The spark gap can be set very close as it has no power arc to interrupt. This makes the arrester extremely sensitive. The spark gap can even be short circuited without causing any harm, as the shunt resistance is made high enough to stand line voltage without overheating or wasting any appreciable amount of power. This, however, although making the arrester more instantaneous in its protective action, will somewhat reduce its total protective value.

In operation, the static charge bridges the spark gap and passes through the condenser which acts practically as a short circuit to the high frequency static disturbances. The line condenser has a capacity as great as the average 10 miles of trolley wire, so that if used five to the mile, it quickly absorbs any charge that the line can hold. The 750 volt car type has a capacity equivalent to about 40 and the 1500 volt car type to about 80 miles of average line.

Construction. The condenser is of tubular form and the resistor, a composition rod, is enclosed in its center. It is imbedded in insulating gum in a black wooden case. The spark gap is enclosed in a separate compartment of the case having a hinged door for inspection. The base of the case is extended at both ends to provide means for mounting on car or poles.

TYPE K LIGHTNING ARRESTERS

WESTINGHOUSE LIGHTNING ARRESTER AND FUSE BLOCKS

Closed No. 48814. Fuse Type Lightning Arrester Open

Fuse Type Lightning Arresters

For Single Phase Alternating Current Railway Systems—Voltages Up to 11,000

Operation. The simplest and cheapest method of accomplishing the desired results is by a lightning arrester with a simple adjustable spark gap and an expulsion fuse. The spark gap holds the normal voltage, but breaks over completely when the voltage is excessive. This spark gap, as will be seen from the illustration, can be adjusted by the screw terminals for any normal voltage from 0 to 20,000 and fastened by lock nuts. The fuse permits the lightning discharge to go freely to ground, but the short circuit is opened immediately after the discharge passes by the blowing of the fuse which releases the tube. The action of the breaker is positive and direct without chance of failure.

List No.	Description	List Price
48814.....	Fuse Type Lightning Arrester for 6600 volts.....	\$14.58
93590.....	Fuse Type Lightning Arrester for 11000 volts.....	16.20

GARTON-DANIELS LIGHTNING ARRESTERS

No. 50016

No. 50041

No. 50401

No. 50400

Direct Current Types

Direct current arresters, station type, are furnished with highly polished and lacquered metal work. Pole or car arresters have a dipped metal finish, but aside from this, are the same as the station type. Pole and car arresters are furnished in either wooden or iron covers, as required. Iron covers are, however, not furnished on the Types EH, EI and EJ arresters. Both covers are of standard design, fitted with insulated bushings for the leading-in wires and the arrester carefully insulated from the cover.

Direct Current Arc Arresters

Standard types of Garton-Daniels Arc Circuit Lightning Arresters are listed below. These will meet practically all standard conditions. Arresters for higher voltages, or for special conditions, can be furnished to order.

Description and List Prices

List No.	Type	Voltage of Circuit	Description	Net Weight Each	List Price Each
50077.....	BD	Up to 4000	Station type	6¾ lbs.	\$8.80
50078.....	BD	Up to 4000	Wood covered	12½ lbs.	8.80

Panel Board Types

Garton-Daniels Panel Board Arresters are especially designed for the protection of electrical machinery, either A. C. or D. C., where lightning conditions are unusually severe.

The line or feeder runs to the upper choke coil terminal while to the lower choke coil terminal is connected the feeder from the apparatus to be protected.

The upper lightning arrester unit is connected on the line side of the first choke coil; each of the other two being connected ahead of the other coils. These units are supplied with a common ground, the connectors being run in back of the two lower units as can be seen in the illustrations.

As to the operation of this arrester, assume that a charge has been set free on the line. The first choke coil chokes back most of this and discharges it over the first arrester unit. The leakage charge through the first choke coil must, as can be seen, pass two other choke coils before it can get into the apparatus. Almost perfect lightning protection therefore may be expected on apparatus protected with these panel board arresters.

These panel board arresters are designed especially for the protection of apparatus up to 6600 volts A. C., up to 2500 volts D. C., railway, and up to 6000 volts D. C., arc, and are furnished in any ampere capacity for voltages within this range.

They are made in double and triple type, one of either type being necessary for the protection of each wire running into or from the apparatus to be protected. They are furnished regularly for station use only, as operating companies usually desire to build small arrester houses to house them for outside installations.

Station panel boards are mounted on heavy impregnated oak frames and are furnished complete with insulators for their installation. The arrester units are furnished with highly polished and lacquered metal work. Choke coils are of copper, black enameled and baked.

DIRECTIONS FOR ORDERING

In ordering Garton-Daniels Panel Board Lightning Arresters, it is necessary that the following information be given:

Type desired—Double or triple.

Class of circuit—D. C. or A. C. If D. C., whether grounded or ungrounded, single, two or three wire. If A. C., whether single, two or three phase; two, three or four wire, grounded or ungrounded.

Voltage of circuit.

Amperes per wire in D. C. work or per phase in A. C. work.

Size of wire or cable for which terminals are to be provided, and number of terminals for heavy capacity circuits.

List Prices. For estimating purposes only, an approximate list price may be obtained on Garton-Daniels Panel Board Arresters by adding together the list prices of the arrester units suited for the voltage of circuit (two units for double type, three for triple type), the list price of suitable capacity, AF or AMF choke coils, and adding to this sum \$20.00. The list price so obtained will be approximate, and is subject to regular discounts.

GARTON-DANIELS CHOKE COILS

Type S Choke Coil

AMF Choke Coil

Car Choke Coil

Standard Types

Choke coils regularly carried in stock are listed below. Coils of higher ampere capacity than these will be furnished to order. In ordering choke coils always give the following information: manufacturer's number, capacity in amperes, size of wire or cable for which terminals are to be provided, number and size of terminals on each end when ordering type AMF coils, mounting, standard or special.

GARTON DANIELS DISCONNECTING SWITCHES

HIGH VOLTAGE TYPES

Garton-Daniels Disconnecting Switches

All Type R disconnecting switches listed hereafter with the exception of Type RM are constructed with a base of standard channel iron. Iron pins are riveted to this base, and insulators cemented to these pins support iron caps, which in turn support the terminal blocks, terminals and switch proper. Each channel is provided with $\frac{1}{8}$ inch holes at each end.

Switches are not furnished with switch locks, switch stops, etc., as are listed on following pages excepting Type RU which includes a switch lock as standard equipment.

Type R is for indoor service while the Type RU of the underhung type is particularly for outdoor service.

Type RM, illustrated on following page, has same switch structure as Type R, but is mounted on blue Vermont marble base and is for indoor service.

Directions for ordering are the same as for choke coils on preceding page.

GARTON-DANIELS CHOKE COILS
HIGH VOLTAGE TYPES

13200 Volt, 200 Amp. Type L Choke Coil

13200 Volt, 200 Amp. Type LU Choke Coil

23000 Volt, 200 Amp. Type H Choke Coil

23000 Volt, 200 Amp. Type HU Choke Coil

Garton-Daniels Choke Coils

Type L choke coils, as illustrated above, are designed for indoor service. The Type LU choke coils are of the underhung type and are designed particularly for outdoor service. The Type H choke coils are of the well-known "hour glass" type and are for indoor service. Type HU choke coils are of the underhung type and are designed particularly for outdoor service. All types of choke coils listed in the following pages are made with a base of channel iron, into which iron pins are riveted and insulators cemented to these pins support iron caps, which in turn support the terminal blocks and coil proper. Channel bases in all types are drilled with $\frac{1}{2}$ inch holes in each end; the coil may so be mounted on any flat supporting member by bolts or lags; or by the use of pipe clamps described and listed in following pages they may be readily supported by piping.

Directions for Ordering

In ordering choke coils and disconnecting switches it is necessary to give the following information in order that the may exactly meet requirements.

List number; voltage; capacity in amperes; size of wire or cable for which terminals are to be provided; number and of terminals on each end when ordering Type AMF and High Voltage Coils, mounting—standard or special, and drilling base, if other than standard drillings are required.

Protective Apparatus and Switchboard Accessories 72-2 & 72-3

GARTON-DANIELS CHOKE COILS

High Voltage Types

The construction of both the high voltage choke coils and disconnecting switches will be apparent from the illustrations below. A standard 3 inch channel iron is used for the base. This permits either the coil or the switch to be installed inside or out, attached to pipe or other suitable supporting means. Iron pins are riveted to this channel, and insulators cemented to these pins support cemented galvanized iron tops, which in turn support terminal blocks for either the coil or switch blades.

All choke coils and disconnecting switches are provided with separable terminals. Switches are operated by means of wood switch hooks listed. For use as a lightning arrester disconnecting switch the 200 ampere size should be specified. For other work the size specified should, of course, be governed by the ampere capacity of the circuit on which they are to be used.

In ordering choke coils and disconnecting switches always give the following information:

Mr. Nos., voltage, capacity in amperes, number of terminals and size of wire or cable for which terminals are to be provided, mounting, standard or special, and drillings in base.

CARBON PILE LIGHTNING ARRESTERS

High Voltage Types

The construction of both the high voltage choke coils and disconnecting switches will be apparent from the illustrations below. A standard 3 inch channel iron is used for the base. This permits either the coil or the switch to be installed inside or out, attached to pipe or other suitable supporting means. Iron pins are riveted to this channel, and insulators cemented on pins support cemented galvanized iron tops, which in turn support terminal blocks for either the line or switch.

All choke coils and disconnecting switches are made with 1/2 inch wide terminals. Switches are operated by means of wood switch hooks listed. The use of a disconnecting switch is recommended for the 300 ampere size should be specified. For other sizes and capacities of the circuit, the disconnecting switch should be specified.

In ordering choke coils, specify: Mr. No., voltage, terminals are to be provided. In ordering disconnecting switches, specify: Mr. No., voltage, terminals are to be provided.

Compression Chamber Multigap Arresters

FOR POLE USE ON CONSTANT POTENTIAL ALTERNATING CURRENT CIRCUITS

The compression chamber multigap arrester is designed to meet the demand for an arrester which will give good protection, at such a price that the device can be placed at terminals of even the smallest transformers. This arrester consists of a series of multigaps and a resistance rod slipped into a porcelain tube. It will be noticed from the illustrations that the brass alloy electrodes with the small porcelain separators make a small closed chamber. During a discharge, the gases formed by the arc and held within these chambers become slightly compressed and assist in extinguishing the arc by partially smothering it. This feature gives the arrester its name. The antennae are connected to the ground lead and consist of two narrow strips of metal on each side of the multigaps. The effect of the antennae is to lower the break-down or spark voltage of the gaps. Thus the arrester has the advantage of a large number of gaps as regards cutting off the generator current, and at the same time has the advantage of a small number as regards the spark over voltage. This feature accounts for the remarkable degree of protection and reliability afforded by this arrester.

The 2200-volt arrester, List No. 79218, shown in the illustration, has eight gaps and a 30-45 ohm cerium rod. The arresters for higher and lower voltages are a modification of the design illustrated, differing in the number of gaps and the amount of resistance. The porcelain tube is sealed in a porcelain base, a metal cap is clamped over the top of the tube, a porcelain cap is then compounded over the metal cap, making a weatherproof top for the arrester.

Graded Shunt Resistance Multipap Lightning Arresters
FOR CONSTANT POTENTIAL ALTERNATING CURRENT CIRCUITS

The graded shunt resistance multipap arrester consists of a series of gaps shunted in part by two resistance rods. The lightning discharge may take place through the gaps or through a series of the gaps and either resistance rod, depending upon the strength and quality of the lightning. The arrester thus provides three paths for the discharge of lightning, making it a very efficient protector. The generator current which follows the discharge shunts to one of the resistance rods and is thus limited to a safe value. The time vapor which forms in the gaps during the discharge prevents the reversal of the generator current which is there shut off at the end of the half cycle following the discharge. For line use the arresters are enclosed in substantial, weatherproof cast-iron lined wooden boxes.

G. E. LIGHTNING ARRESTERS

Nos. 164404 and 164406
Magnetic Blowout Arrester

Nos. 164403 and 164405
Magnetic Blowout Arrester

No. 47558
Horn Type Arrester

Magnetic Blowout Arresters

This arrester consists of an adjustable spark gap in series with a resistance. Part of the resistance is shunt with a blowout coil, between the poles of which is the spark gap. The parts are mounted in a strong porcelain box which for car and pole use is in turn mounted in a substantial asbestos lined wooden box.

How the Arrester Operates

When the lightning potential comes on the line it causes the spark gap to break down and a discharge occurs through the gap and the resistance rod to ground. Part of the current shunts through the blowout coil, producing a strong magnetic field across the spark gap. The magnetic field blows out the discharge arc and restores normal.

C. E. LITCHFIELD & SONS
CHIEF EXPULSION FUSES

Single Pole Fuse Block for 2500 Volts

Single Pole Fuse Block for 7500 Volts

Expulsion Fuse Holders and Fuses

Type T, Form D-3

The TD-3 expulsion fuse is a simple and effective device for operating on overload and short circuit conditions.

Capacities 100 and 200 amperes 2500 and 7500 volts.

This fuse holder consists of a heavy insulated metal bulb or explosion chamber into which is screwed a fiber tube. At each end are contact blades and accessible binding screws for the fuse, the lower binding screw being carried on the screw plug in the "breach" of the explosion chamber.

The fuse proper which passes through the tube and bulb is made of comparatively small cross section at the lower end, to insure rupturing inside the bulb. The explosion and sudden expansion of gases expels the arc and fused metal, and effectively opens the circuit.

These fuses are assembled in the form of complete fuse blocks, single, double and triple-pole, both 2500 and 7500 volts, and four-pole for 2500 volts.

The clips for the 2500 volt fuse holders are mounted directly on marble base of panel, while those for the 7500 volt holders are mounted on one piece porcelain insulators, which in turn are mounted on plate base or panel.

Barriers are provided for the double, triple and four-pole fuse blocks on bases.

Single pole elements complete with contact clips, but without bases, are listed separately for panel mounting. The necessary barriers are also listed in the same way.

Western Electric
SMALL ELECTRIC PLANT EQUIPMENTS

Equipment Complete
 Belted to an Engine

DESCRIPTION

The time and money saving advantages of these powerful, built-for-business electric plant equipments will appeal to every practical man. They consist of a 16 cell storage battery, a switchboard and a generator, all mounted on a single skid properly connected and ready for use.

The switchboard is so arranged that it can be folded down without disturbing any of the electrical connections, making a compact unit which can be crated and shipped to the place of installation in the box shown in the illustration on following page.

The boxed outfit is small enough and light enough to be handled on an ordinary farm wagon and the complete equipment can be unpacked and put in operation with much less labor than is required to install an engine or a pump.

Every electric plant must include a storage battery, switchboard and generator. When these come to the place of installation separately, experience has shown that there is considerable uncertainty as to the amount of time required to install them. Frequently, some one part of the shipment is delayed in transit, resulting in loss of time not anticipated or provided for in the estimate, and which constitutes an unpleasant and unforeseen addition to the cost of installation.

The use of these Western Electric plant equipments makes it possible to cut out of the estimate practically all of the work of installing the electrical equipment. That is to say, laying out the plant, assembling the switchboard and battery, placing the generator, wiring between the switchboard, battery and generator, testing the connections and polarity, giving the battery the usual initial charge and many other time-consuming and costly details.

This convenience of installation is accomplished without the least sacrifice of quality or operating value. On the contrary, the storage battery, the generator and the switchboard are each the best of their kind and the arrangement is such as to make every portion of the plant completely and easily accessible when in operation.

These equipments are built to give real service and to win the enthusiastic praise of the owner, not only for a few days but after years of use. They are built by engineers to win the approval of engineers, and the more critically and intelligently they are examined the more apparent is their value.

However much a man, living beyond the reach of the wires of a public electric lighting company, may wish to enjoy the benefits of electric light and power service, the amount that he can afford to spend is usually limited. When a considerable portion of his investment must go to cover the installation expense he is frequently obliged to select a plant of insufficient power to really meet his need

Western Electric

SMALL ELECTRIC PLANT EQUIPMENTS

Showing Equipment Unpacked

Showing Equipment Packed

DESCRIPTION—Cont'd

The purchaser of a Western Electric Plant saves installation expense and obtains for his money a larger and a better plant.

This results in greater satisfaction all around; to the purchaser because he gets the most for his money; to the man who makes the installation because the job is clean-cut and simple and his profit a fair one; to the manufacturer because an enthusiastic owner is his best advertisement.

The Western Electric Plant Equipment is made in four sizes, of which the smallest will be found just right for the average small farm or other private residence, while the largest is big enough for practically any service for which a low voltage plant is suitable.

The storage battery is the heart of the electric plant.

The "**Hyrap-Exide**" Battery is the strongest and sturdiest battery of the Faure or pasted plated type known to the trade. It is specially designed for small plant service; in fact is simply a miniature of the immense "**Exide**" Standby Batteries used in large numbers by the Central Lighting and power stations in New York, Chicago, Boston, Brooklyn and other large cities.

The "**Exide**" Battery, in the numerous forms in which it has been developed and of which the "**Hyrap-Exide**" is one, is the most widely used storage battery in the world.

Each battery consists of 16 cells assembled in 4 trays containing 4 cells each and joined by bolted connections. The cells are equipped with rubber covers and are shipped assembled, sealed and charged.

The battery trays are securely fixed on the skid and carefully cushioned. A box cover is provided for the battery, which completely encloses and protects it from dirt, dust, etc. When the battery is in use, this cover may be removed or left in place, as desired.

The Western Electric Type B Generator which is used with the plant embodies in its design and construction the most advanced ideas in electrical and mechanical construction.

The simplicity and ruggedness of its construction adapt it particularly for this class of work. The generator consists of a cast steel field frame upon which are fastened the end bearing brackets for supporting the armature. The armature is built up on a steel shaft of liberal dimensions. These brackets are interchangeable and can readily be removed for inspection.

The generator is self-lubricating, the oil circulation being maintained by the revolving shaft, and a steady flow of oil is insured while the generator is working. Occasional inspection should be made of the oil-wells to see that they contain clean oil in sufficient quantity.

The generators are shunt wound, generate current at 32 to 42 volts, and operate at 2000 revolutions per minute. A sliding base is furnished so that the proper belt tension may be readily maintained. A pulley and spare set of brushes are included with each plant.

In ordering these plants the speed of the engine that will drive the generator and also the diameter of the flywheel in inches, must be given in order that a generator pulley of suitable diameter may be supplied.

Western Electric

SMALL ELECTRIC PLANT EQUIPMENTS
SMALL ELECTRIC PLANT EQUIPMENTS

Switchboard

DESCRIPTION CONT'D
Type E Switchboard

The Type E Switchboard is simple, yet complete. The design, workmanship and materials are of the best, special care being used in selecting only such materials as conform to a very high standard. The instruments, switches, etc., are high grade and such as are usually found only on much more expensive switchboards. The general arrangement has been worked out with great care by competent engineers who are thoroughly conversant with small plant switchboard requirements as the result of experience gained in the installation and operation of great numbers of such plants.

The arrangement permits of the following operation:
1. Lights to be run from battery only, or
2. Lights to be run from generator and battery in parallel, the battery assisting the generator or
3. Lights to run from generator only.

In the ordinary operation of the plant, no hand manipulation of switches or any part of the switchboard apparatus is at any time necessary except adjustment of the generator current by means of the generator field rheostat.

The National Board of Fire Insurance Underwriters issue rules covering switchboard construction which are designed to secure safety and minimum insurance rates. In small plants, switchboard construction safety is often sacrificed to cheapness.

The Type E Switchboard meets in every detail the most exacting requirements of the National Board of Fire Insurance Underwriters.

Hand manipulation of switches is superseded by the automatic operation of the automatic cut-out and cut-off switch. This switch is simple, durable and reliable. It has no adjustments because it needs none.

The ampere hour meter, which is a feature of these switchboards, is of great practical value. It is connected to the battery and indicates at all times the current in amperes hours taken out of the battery. The hand moves from "Full" toward "Empty" when the battery is discharging and from "Empty" toward "Full" when the battery is charging. It is arranged to run somewhat slow on charge, and thus automatically provides for the necessary reserve of ampere hours of charge to cover ampere hours of discharge. It is provided with a contact at the full point, at which a lamp may be made to light a lamp or ring a bell when the meter hand reaches that point, or to actuate a circuit opening device in the engine ignition circuit, shutting the engine down when the charging operation is completed.

The ampere hour meter is used for the following purposes:
1. To show when the battery needs to be charged.
2. While charging to show at what rate the charging may be done, permitting the use of relatively high charging rates and thus shortening very materially the hours of engine operation for battery charging.

3. To show when the battery has been fully charged and charging may be discontinued.

4. As a positive safeguard (if the simple instructions are followed) against "useless, wasteful and injurious overcharging or overdischarging of the battery."

5. As a continual and valuable check on the battery performance, and therefore on battery condition. To measure the daily or weekly current consumption, or the current used by various motors or other devices, using current meter contacts in the performance of some specific task, and to obtain other data of like character, which is helpful in operating the plant with economy, in preventing the waste of current, etc.

6. To show, when such is desired, a signal by light or bell, that the battery charge has been completed and should be discontinued, or to actuate a stop charge device.

The ampere hour meter is a rather expensive instrument, and it has not hitherto been thought possible to furnish it as regular equipment on the switchboard of a small and necessarily low priced light and power equipment. Its inclusion without extra cost in the structure of these switchboards indicates the "maximum possible value for the money." Policy of the company has governed the design, execution and price of the "Type E" Switchboard Plant Equipments.

Rectifiers, Storage Batteries and Lighting Plants

W. O. B. FACTORY **SMALL ELECTRIC PLANT EQUIPMENTS** **DESCRIPTION—Cont'd**

Type E Switchboard **Other Details**

RATED CAPACITY, 30 amperes, 32-42 volts.

PANEL of black oil finished slate, 1 x 24 x 18 inches, on heavy strap iron frame.

GENERATOR AND BATTERY SWITCHES are double pole, single throw, 60 ampere, with 50 ampere enclosed fuses.

AMPERE HOUR METER is of differential type, scale 0-150, connected in battery discharge and charge circuit.

AMPERE METER, connected in battery discharge and charge circuit, scale 50-0-50.

PILOT LIGHT connected across generator leads.

AUTOMATIC SWITCH connected in generator circuit. Automatically closes generator circuit to line when the generator voltage rises to proper value and opens on small reverse current.

GENERATOR FIELD RHEOSTAT. For controlling generator current.

GROUND DETECTOR LAMP SOCKETS for testing for grounds.

The skid is substantial and of neat appearance.

When set on a solid floor there is practically no vibration of the switchboard when the generator is running.

The over-all dimensions of the skid are 29 inches wide by 50 inches long. The belt may run to the generator from either side.

Generator Battery

Plant Equipments

Switchboard

Plant Equipment No. 1 is a 12-light plant. One battery charge will light 12-12 c.p. (15 watt) Mazda lamps for about 8 hours or 12-12 c.p. lamps for about 6 hours continuously or give an equal amount of light in lamps of other sizes.

The generator will carry continuously about 750 candle power in Mazda lamps or two large flatirons or a one horse power motor, or other equivalent load.

The battery can be given a complete normal charge in less than six hours.

Plant Equipment No. 2 is a 12-light plant. One battery charge will light 20-12 c.p. (15 watt) Mazda lamps for about 8 hours or 30-12 c.p. lamps for about 6 hours continuously or give an equal amount of light in lamps of other sizes.

The generator will carry continuously about 750 candle power in Mazda lamps or two large flatirons or a one horse power motor, or other equivalent load.

The battery can be given a complete normal charge in less than six hours.

Plant Equipment No. 3 is a 20-light plant. One battery charge will light 20-12 c.p. (15 watt) Mazda lamps for about 8 hours or 30-12 c.p. lamps for about 6 hours continuously or give an equal amount of light in lamps of other sizes.

The generator will carry continuously about 750 candle power in Mazda lamps or two large flatirons or a one horse power motor, or other equivalent load.

The battery can be given a complete normal charge in less than six hours.

Plant Equipment No. 4 is a 30-light plant. One battery charge will light 30-12 c.p. (15 watt) Mazda lamps for about 8 hours or 45-12 c.p. lamps for about 6 hours continuously or give an equal amount of light in lamps of other sizes.

The generator will carry continuously about 750 candle power in Mazda lamps or two large flatirons or a one horse power motor, or other equivalent load.

The battery can be given a complete normal charge in less than six hours.

Plant Equipment No. 5 is a 40-light plant. One battery charge will light 40-12 c.p. (15 watt) Mazda lamps for about 8 hours or 60-12 c.p. lamps for about 6 hours continuously or give an equal amount of light in lamps of other sizes.

The generator will carry continuously about 750 candle power in Mazda lamps or two large flatirons or a one horse power motor, or other equivalent load.

The battery can be given a complete normal charge in less than six hours.

Western Electric

SMALL ELECTRIC PLANTS

Switchboard

20 Amp., 32-42 Volt Generator

Storage Battery

Plant Equipments

The two equipments listed below for lighting of residences are known as plant No. 9 and No. 10. Plant No. 9 is large enough to light the average farm residence having 25 to 30 connected lights. Plant No. 10 will light a residence having 40 to 50 connected lights. An electric iron, a toaster stove, electric fan or similar small electrical devices can be operated from either plant.

Storage Battery. The storage battery consists of 16 cells of the Electric Storage Battery Co. Hy-ray Battery with three counter cells. All parts necessary to install the battery and place in operating condition, including five trays, bolt connectors, lead tape, hydrometer syringe, etc., are furnished.

Generator. The generator is a Western Electric bipolar machine complete with pulley, sliding base for adjusting the belt tension and rheostat for controlling the voltage.

Switchboard. The switchboard is arranged so that if desired the generator can supply power to the lights at the same time it is charging the storage batteries, or it will operate the lights independent of the battery, or charge the battery independent of the lights. It is equipped with a contactor which opens the generator circuit when the engine slows down momentarily and thus prevents the battery current from feeding back to the generator. A switch is also provided which converts the generator into a motor for cranking the engine. The voltmeter is provided with a voltmeter switch so that it is possible to read the voltage of the lights or the voltage of the battery or the voltage of the dynamo. An ammeter switch is furnished, which makes it possible to read either the current being supplied by the dynamo or the current in the battery circuit.

Western Electric

LIGHTING PLANT COUNTER CELL EQUIPMENT

In a large majority of cases the engine and generator are run and the battery charged only in the daytime, and current for the lights during the evening hours is taken exclusively from the battery. This method of operation is by far the most convenient, and is the one for which the Standard Type E Switchboard is designed. In some few plants it may be desired to do a considerable amount of lighting while the battery is being charged. It may not be convenient to run the generator except during the evening hours, or it may be necessary to run a considerable number of lights during daylight hours.

To charge the battery requires a pressure higher than the normal lamp voltage, and if the lamps are burned habitually under this pressure they will be abnormally bright and their life reduced. When, therefore, it is necessary to burn many lamps and to charge the battery at the same time, it is customary to provide some means to reduce the charging voltage to the proper value for the lamps, which is approximately 32 volts.

To accomplish this counter cells (resistance cells) may be connected in the lighting circuit while charging is being done, or a switch may be provided by means of which the lighting circuit may be temporarily connected to 13 cells of the battery instead of to the full battery of 16 cells.

Either of these arrangements requires the use of a single pole, double throw switch in addition to the switches provided on the Standard Type E Switchboard. Such a switch is omitted from the Standard Switchboard because it is not ordinarily required. When, however, either the counter cell or end cell regulation feature is desired it can be easily obtained by adding to the Standard Type E Switchboard the counter cell or end cell switch and panel, which is furnished complete with mountings and connections.

16 Cells, Type EEG-7 Battery. In Glass Jars Mounted on Rack

For 32 Volt Isolated Electric Plants for Lighting and Power

Hydrazine oxide batteries are particularly adapted for use in small electric lighting plants and central stations where the consideration of initial investment does not allow the use of the more expensive Chloride Accumulators.

88. **Types.** The Hyrax-xide batteries are assembled in glass jars, and are shipped, unassembled. But be assembled and charged by the purchaser, and also in rubber jars, in which case they are charged before shipment and are ready for use upon arrival at destination.

Construction. The batteries are of the "pasted-plate" type, and are made of the same materials and have the same general design as the powerful excite standby batteries used by the Central Lighting and Power Stations in New York, Chicago, Boston, Brooklyn, and other large cities.

Capacity: The Hyrax oxide batteries listed will operate at from about 32 volts at the beginning of the discharge to about 23 volts at the end of discharge.

64 and 110 Volt Service. For 64 volt and 110 volt service the average discharge voltage per cell may be figured at 2 volt on the basis of which 32 cells would be suitable for 64 volt plants and 55 for 110 volts. It is customary, however, to provide 33 cells for 110 volt service.

01. The Type DDG plates are 5 7/8 inches wide and 6 inches high and the elements consist of 5, 7, 11, 13, 15 and 17 plates. 01
EEG plates are 7 3/4 inches wide and 7 3/4 inches high and the elements consist of 5, 7, 9, 11, 13, 15 or 17 plates. Overall height
of Type DDG cells, trays and insulators is 17 1/2 inches and of EEG cells, trays and insulators, 19 1/4 inches. 01

[illegible]

*Balance Material: 16 glass jars, 16 covers and 16 sand trays together with two extra each of the glass jars, covers and sand trays. The necessary number of wood separators, lead tape, bolt connectors, 2 socket wrenches, sand, electrolyte, carbon plugs, hydrometers and packing.

00.00-00.01 Balance Material: 8 glass jars, 3 covers and 3 sand trays. The necessary electrolyte, jug, bolt connectors and

PORTABLE STORAGE BATTERIES

No. 501

No. 504

"Chloride Accumulator"

For portable use in connection with phonograph, kinetoscope, other small motor work and small electric lamps, the "Chloride Accumulator" is put up in sealed rubber jars enclosed in hardwood case provided with handles and suitable connection terminals. Unless otherwise ordered, portable batteries will be shipped filled with electrolyte and charged ready for service.

Each cell, when discharging, gives approximately two volts, and as all the cells in a case are connected together in series, the number of cells multiplied by two will give the approximate voltage between the outside connectors of each case.

The normal rate is the highest rate in amperes at which the battery should be charged. At this rate the battery will be fully charged in nine hours and discharged in eight hours.

Rectifiers, Storage Batteries and Lighting Plants

PORTABLE STORAGE BATTERIES

Four SS 9 Signal Cells Assembled in Case. Mfr. No. 8484
(Side of case and jar cut away to show construction)

The "Exide" Battery

Batteries of the "Exide" type have been exclusively used in railway signal and interlocking service to replace primary cells for operating the semaphores. As each cell of storage battery replaces 8 or more primary cells for this service, and the attention required is also reduced to a minimum, their superiority is apparent.

They are also largely used for small motor work where a large capacity for a minimum weight is desirable.

Unless otherwise ordered, these batteries are shipped filled with electrolyte and charged ready for service. Each cell, when discharged, gives approximately two volts, and as all the cells in a case are connected together in series, the number of cells multiplied by two will give the approximate voltage between the outside terminals of each case.

PORTABLE STORAGE BATTERIES

Two-Plate Type, "Chloride Accumulator"

This type of the "Chloride Accumulator" is especially suitable for service where only a small capacity is required. The positive plate of one cell and the negative plate of the adjacent cell are fused to one connecting strap and the pair are supported on the edges of the two adjacent glass jars.

By this method no connecting bolts or burning are required to install any number of cells in a group, and there are no contacts to corrode or become loose.

These cells have demonstrated their superiority for police and fire alarm signaling, telegraph, laboratory and experimental service.

The resistance between cells is practically eliminated—this feature being an item of importance in cells of small capacity.

Unless otherwise ordered, these batteries are shipped filled with electrolyte and closed ready for service. Each cell, when discharged, gives approximately two volts, and as all the cells in a case are connected together in series, the number of cells multiplied by two will give the approximate voltage between the outside terminals of each case.

MULTIPLE MERCURY RECTIFIERS

Standard Battery-Charging Rectifier, 60 to 140 Cycles

Standard Battery-Charging Set, 60-140 Cycles

The mercury arc rectifier is used for changing alternating to direct current, efficiently and economically. In the new design rectifier listed below the compensating balance is used in a modified form having no taps except the neutral point and consequently no dial switch, and simply serves the purpose of furnishing a neutral point for the negative side of the direct current and also gives the relative effect necessary to keep the rectifier tube operating during the time which the alternating current takes to cross the zero line.

Western Electric

D. C. Multiple and Power Circuit Form 2, 5 and 6 A. C. Series Form 2, 5 and 6 Series or Multiple
or Multiple Flame Lamp Flame Lamp showing lamp ready for trimming

Long Life Enclosed Flaming Arc Lamps—Type W

The Western Electric Type W Long Life Flaming Arc Lamp is an economical and highly efficient lamp and produces a powerful, penetrating light so that it is especially adapted for illuminating large areas and for general street lighting. It is easily installed in locations where it is impossible to hang any other arc lamp.

Due to a careful choice of the carbons used, as well as an improved and simplified feeding mechanism which not only maintains the proper arc length constantly, but keeps the arc in one fixed position, the maximum quantity, best quality and most efficient distribution of the light are the characteristics which place this lamp far ahead of all others.

The advantages of the Type W Lamp over other types of flaming arc lamps are:

The maximum illumination is 10 degrees below the horizontal. The brilliancy of the illumination remains unimpaired throughout the trim. Either a white or yellow light can be obtained, depending on the carbons used. The arc is steady, burns without any apparent flicker and is always maintained in the same position from the start to end of trim. The carbons have a life of from 120 to 140 hours and only one has to be renewed as the stub at the upper carbon can be used for the lower carbon at the end of each trim. The mechanism is simple and reliable and follows closely the design of the standard enclosed arc lamp, which is familiar to all arc lamp men. The clutch is sensitive but very positive in operation and acts on a machined surface instead of upon the carbons. The focusing rod is suspended from the center of gravity, thereby eliminating friction. The upper carbon holder carries a weight of approximately 12 ounces which crushes any slag that might form on the carbon points. The arc chamber is absolutely air tight, and the protection afforded the inner globe by the outer globe in cold weather prevents the condensation of fumes on the inner globe. All parts of the lamp are accessible. The casing is telescopic, weatherproof and insectproof. The lamp is very easily trimmed. The compensator is highly efficient and noiseless in operation. Ten thousand of the series lamps have been purchased for street lighting by the city of Chicago and additional purchases are contemplated, while thousands of the multiple lamps are in use in the leading industrial plants of the country.

Alternating and Direct Current Compensarcs

25, 30 and 35 AMP. OUTLET

General Mechanical Construction

The compensarc is a transforming device built with special reference to operating an alternating hand feed arc lamp with used with picture machines, requiring approximately 35 volts across the arc and a steady current of from 30 to 60 amperes.

The construction of this device is very substantial and embodies all the careful features of design and finish that is carried out in our standard lines of transformers.

Electrical Characteristics

The following embodies some of the principal characteristics of the alternating current compensarc:

- 1. The device has an electrical characteristic which enables it to hold the arc steady at predetermined current values through a considerable range in the height of the arc.
- 2. The current value at short circuit is such that it will not blow the fuse, providing the fuse has a capacity slightly in excess of the normal operating current.
- 3. It is highly efficient, having low core loss and copper loss, resulting in a low operating temperature.
- 4. It has the feature of adjustment of the switch so as to operate at an short circuiting from step to step the circuit is at no time open.
- 5. The compensarc is designed to operate at the same time as the lamp is being operated, and at the same time maintain the stability of the arc.

Connections

The compensarc is a self-contained device and requires no auxiliary rheostats or other controlling mechanisms. Through the top of the cover of the compensarc four leads are brought through porcelain bushings, two of which are marked "Lamp," and these should be connected to the lamp terminals. The other two should be connected to the operating circuit or line. No other connections are necessary.

As this is an alternating current device, there is no positive or negative lead.

DIRECT CURRENT COMPENSARCS

In communities where direct current is supplied to moving picture houses, hand feeds are generally used to cut down the line voltage to the required voltage at the arc. This is, of course, a very inefficient method and in such cases the direct current compensarc should be used. This device consists of a direct current motor built to operate on direct current currents of 115, 230 or 450 volts, directly connected to a direct current generator which runs down the voltage to the voltage required at the arc, approximately 35 volts.

This device shows a very good efficiency and is a very economical device as compared with the hand feed.

General Mechanical Construction

The direct current compensarc is constructed by using two frames connected together by means of a special casting. The sets have two bearings, two field frames and two armatures. The armatures are mounted on one shaft. The sets are constructed with two leads.

Electrical Characteristics

The electrical characteristics of the direct current compensarc are similar to those of the alternating compensarc. However, each frame is equipped with special windings, so as to give a volt ampere characteristic curve, such that when the current at the arc reduces, the voltage increases, thus insuring a stable arc. The compensarc is constructed without using any lamp steadying resistance. On account of the characteristics of the set, if carbons are held in contact, the mains are not short circuited.

The field rheostat can be adjusted to deliver steady arc current from 20 to 45 amperes, approximately.

The sets are designed on the basis of an arc consumption of 25 amperes, 50 volts.

Connections

At the motor end of each set will have three terminals, and the same procedure will be followed in connecting up the set about wound motor, the middle lead being the main line lead. The generator end will be equipped with two terminals connected to the 250 lamp line.

In addition to this, two small leads from the field rheostat are connected direct to a closed circuit rheostat, which rheostat is to be used for adjusting the current of the arc.

Note: See following page for details of construction and wiring.

Western Electric

COMPENSARC (CONTINUED)

Alternating Current Type A, Form 4

List Prices and Data

List No.	K.W.	Volts	Cycles	Shpg. Wt.	List Price

INCANDESCENT LAMP SEARCHLIGHT

Incandescent Lamp Searchlights

These lamps have been developed to meet the demand of motor boats and other small craft for an efficient and effective searchlight capable of being operated on a low voltage circuit. Boats having no electrical equipment other than a 6 volt storage battery for ignition and a minimum amount of lighting with low voltage incandescent lamps can be supplied with an incandescent lamp searchlight either 6 inches or 10 inches in diameter. The current required for these searchlights is approximately 4 amperes. These searchlights are made up in two types of control, i.e., hand and pilot house. The hand control type is equipped with a pedestal adapted for securing directly to the deck. Deck plates for both 6 inch and 10 inch hand control sizes are furnished on special order. The pilot house control is adapted for mounting on the top of the awning supports or pilot house with a lever controlling the motion of the beam from below and convenient for manipulating.

List No.		List Price Each
230249	6 in. hand control searchlight without deck plate.....	\$32.40

Transformers, Arc Lamps and Accessories

"ELECTRA" CARBONS

Pink Label

The "Electra" Pink Label Carbons have no equal for use in **Moving Picture Machines, Stereopticons** or Projector work of any kind, where absolute steadiness of arc and quiet burning are essential. They are equally serviceable on both Direct or Alternating Current.

Quality: "Electra" Pink Label Carbons are made of the very highest grade lamp black, which is manufactured by the carbon factory.

Uniformity: As the "Electra" Pink Label Carbon factory makes its own lamp black it is sure that the raw material is always of the same grade, and for this reason "Electra" Pink Label Carbons are always uniform in quality.

Light: Because of the high grade raw material used in the manufacture of "Electra" Pink Label Carbons, as well as the careful baking, they can always be depended upon to give brilliant steady light.

Arc: It has been proven that "Electra" Pink Label Carbons will draw a much larger arc than any other brand. This is of great advantage in moving picture work for the reason that the operator need not pay all his attention to adjusting the arc.

Resistance: Resistance of "Electra" Pink Label Carbons is very low, which allows a maximum of current at the arc, insuring of course a much more brilliant arc than can be obtained from other brands whose resistance is higher.

Life: "Electra" Pink Label Carbons give longer life than any other brands. This has been proven by a good many practical tests.

Quiet Burning: The use of "Electra" Pink Label Carbons is not accompanied with the hissing and noise which other carbons make, and they always burn very quietly in either A.C. or D.C.

Even Burning: Notwithstanding the high amperage at which carbons are used in moving picture machines "Electra" Pink Label Carbons both upper and lower always burn at an even point, which of course insures a very steady arc, and is not accompanied by a flaring up of the arc which is seen very often with other carbons.

Deposit: Because of the pure material of which "Electra" Pink Label Carbons are made they leave very light deposit, and the operator is therefore not bothered with cleaning his lamp house often of sooty black deposit which he is compelled to do when he uses inferior carbons.

General Advantages: It is a well known fact that carbons are really the most important factors for moving picture projection, and that unless carbons of the very best quality obtainable are used the operator cannot show a clear, well-defined picture. It is, therefore, to the advantage of the operator to always specify "Electra" Carbons, and by doing so he will be assured of getting absolutely the best carbon obtainable.

SERIES INCANDESCENT LIGHTING SYSTEMS

Alternating current is generally supplied at constant potential, consequently, when lamps or other apparatus requiring constant current are used, it is necessary to equip the circuit with some means of transforming from constant voltage supply to constant current. A constant series reactance will maintain approximately constant current if the circuit is highly inductive, but the power-factor will be sacrificed.

In order then to maintain constant current and at the same time a respectable value of power-factor, it is necessary to insert in the circuit a series reactance, which changes with the load in such a manner as to keep the total impedance, and consequently the current, constant.

This variable reactance is obtained in the constant current transformer by means of two coils movable with respect to each other.

In the Western Electric line of movable coil constant current transformers for series incandescent street lighting, one coil is stationary while the other is suspended from a rocker arm to the other end of which weights are attached. These weights, together with the magnetic repulsion between the coils, counter-balance the weight of the secondary coil. At full load the coils should be from 1 to 2 inches apart, and as the load falls off the tendency for the current to rise, due to the decreased resistance of the secondary circuit, is offset by the separation of the coils.

The separation is caused by the greater repulsion of the increased magnetic flux, due to the momentarily increased current in the secondary coil. With the coils farther apart more of the magnetic lines of force from the primary coil go out between the coils as leakage flux and the e.m.f. induced in the secondary is decreased in proportion to the fall in the secondary load, thus maintaining the current at a constant value.

The transformers are designed so that the coils will separate sufficiently to maintain constant current, even when all of the lamps are cut out of the circuit; in other words, they regulate from full load to no load. The center of curvature of the weight sector arm is adjustable, as is also the amount of balancing weight. They can be operated on any primary voltage within 5 per cent. of the normal rated value.

The complete Western Electric line consists of four types of transformers: the Type RB transformer, the Type SA transformer, the Type PD transformer and the Type SL transformer.

The Type RB transformer has the best electrical and mechanical characteristics, and is without doubt the most efficient constant current transformer on the market.

The Type SA transformer contains in its design and construction the highest grade of material, and is to be considered where initial cost is the important factor.

The Type PD transformer has been designed for controlling certain classes of street lighting, where it is desirable to mount the transformer on a pole, and operate it with a time switch. As this transformer has no moving parts, it is well adapted to fill this condition. It is similar in general appearance to the Type H constant potential transformer. In operating high efficiency incandescent lamps it will allow a smaller variation between full load and short circuit than any device on the market except the movable coil C.C. transformer.

A considerable field exists where a transformer of this kind can be used. The field can be divided into two parts, as follows:

1. Where lighting companies run transmission lines through small villages where no lighting is done at the present time, this Type PD transformer will make it possible to install ten to thirty incandescent lamps without necessitating an attendant to watch the operation of the transformer or lamps, the transformer being turned on and off by means of a time switch.

At the present time, these villages are not lighted for the reason that the cost of running special wires from the nearest central station is so high as to make it prohibitive and it is entirely out of the question to put in a central station and employ an attendant to care for the few number of lamps that would be used in these small villages.

2. The transformer will be used extensively in city and suburban lighting where it does not seem desirable to run high voltage series circuits.

Briefly, the field for which the Type PD constant current transformer is particularly adapted lies along high potential transmission lines, in small villages and with lighting plants where first cost is the determining factor.

This transformer is oil cooled and is mounted in a cast iron tank which is weatherproof, being provided with a gasket beneath the cover which prevents the entrance of dust and moisture. The cover is securely clamped down by eyebolts which serve also for lifting the transformer. To simplify installations the two primary and secondary leads are brought out of the tank. The coils have ample oil ducts, which insure a low and uniform temperature throughout the windings. The core and coils are subjected to the well-known vacuum drying and compound filling process, leaving the transformer in a solid moisture-proof and oilproof unit, which is securely bolted in the tank.

The transformer is so designed that it will not be injured when subjected to swinging or dead grounds in any part of the secondary circuit.

It is also designed to have an open circuit voltage which will positively puncture the film cutout when lamp burns out.

The Type PD transformer is desirable because of the fact that it is complete in itself and has no external reactance or choke coils, as it is free from moving parts and it requires no more attention than the ordinary lighting transformer.

The Type SL transformer is intended for lighting series incandescent lamps from series arc circuits. There are numerous places where it is economical to install these transformers, such as railroad bridges, alleys, etc.

Any of the above with reversing key, price, extra, \$5.00.

When reversing key is applied, contact key is omitted.

Prices for instruments with ranges other than those listed will be the same as for those of the next higher range.

MODEL 1 DC AMMETER

For Direct Current

These instruments are extremely compact and will be found very serviceable for rapid work. To provide sufficient carrying capacity for the self-contained shunts, it has been found necessary to make them in three sizes, the main difference being in the arrangement of the binding posts.

Measuring and Testing Instruments

WESTON INSTRUMENTS

Multipliers for Model 1 Standard Portable Voltmeters

For Direct Current

Multipliers are resistance boxes, the coils in which are highly insulated, and are adjusted so that the readings of the instrument may be multiplied by any desired constant. Multipliers are usually constructed so that the indications of the pointer, multiplied by 2, 5, 10, 20 or 50, will give the potential of the circuit.

The multipliers listed below have been designed for use in connection with direct-current voltmeters and are generally used with 120 and 150-volt instruments. Intermediate ranges or subdivisions will be provided when ordered. By the use of the multipliers, the range of voltmeters may be increased to any practical limit.

Multiplying Constant of	Range in Volts of Voltmeter and Multiplier Combined	*List Price Each	Multiplying Constant of	Range in Volts of Voltmeter and Multiplier Combined	*List Price Each
2 for 150 Volts.....	300	\$20.00	30 for 150 Volts.....	4500	\$140.00
4 for 150 Volts.....	600	30.00	50 for 100 Volts.....	5000	160.00
5 for 150 Volts.....	750	40.00	40 for 150 Volts.....	6000	180.00
10 for 120 Volts.....	1200	50.00	65 for 100 Volts.....	6500	200.00
10 for 150 Volts.....	1500	60.00	60 for 120 Volts.....	7200	210.00
20 for 100 Volts.....	2000	80.00	50 for 150 Volts.....	7500	220.00
15 for 150 Volts.....	2250	90.00	60 for 150 Volts.....	9000	260.00
25 for 100 Volts.....	2500	100.00	100 for 100 Volts.....	10000	300.00
20 for 150 Volts.....	3000	100.00	100 for 120 Volts.....	12000	350.00
25 for 150 Volts.....	3750	120.00	100 for 150 Volts.....	15000	400.00
40 for 100 Volts.....	4000	130.00			

For subdivisions, add \$10.00 to above prices for each additional range.

Special prices will be quoted for multipliers for instruments of other ranges than above.

Model 56 Portable Duplex Instruments

Direct Current

Model 56 Duplex

These Duplex Instruments consist of a voltmeter and an ammeter combined in one case. The case is of highly finished natural cherry, has a strongly hinged cover, and serves as a carrying box. All connections are made by means of binding-posts inside of the case. These posts are plainly marked, showing their polarity and to which side of the instrument they are connected.

These instruments are regularly supplied with a single-range voltmeter and a single-range ammeter; they will be supplied, however, with either 2 voltmeter movements or 2 ammeter movements of like or different ranges, if so desired. The voltmeter side may be obtained with a double range at a slight increase in cost. The ammeter is furnished only in single ranges up to 100 amperes with a self-contained shunt, but if multiple or higher ranges are desired they can be obtained by the use of external shunts.

These instruments will be found serviceable for all ordinary testing in which a greater degree of accuracy than 1 per cent. is not desired.

Measuring and Testing Instruments

WESTON INSTRUMENTS

Weston Patent Alloy Shunts

FOR USE WITH PORTABLE STANDARD MILLIVOLTMETER MODEL No. 1

For Direct Current

These Millivoltmeters, in connection with Weston Patent Alloy Shunts, read directly in amperes. Shunts of different sizes can be adjusted to the same instrument, and it can, therefore, be used to measure a current of 2000 amperes with the same degree of accuracy as a current of 1 ampere. The combination of millivoltmeter and shunt is practically compensated for temperature and is correct within $\frac{1}{2}$ of 1 per cent. If at any time the user of this combination desires to employ additional ranges to those for which the instrument is already adjusted, it is simply necessary to purchase additional shunts of the ranges required, thus saving the expense of an additional instrument. The scales of the instrument can be divided into 100, 120 or 150 divisions. In selecting shunts of different range for use in connection with one instrument, it should be considered that the higher ranges must be even multiples of the lower one in order to suit the same scale on the instrument.

These shunts can be supplied in two or more ranges combined in one case, as indicated in price list below.

Shunts with Single Range

WESTON INSTRUMENTS

Model 45 Voltmeter
Voltmeters and Ammeters
Model 45 Portable
For Direct Current

These instruments are designed to meet the demand for a low-priced voltmeter or ammeter of sufficient accuracy for station work and general testing. The movement in this type of instrument is completely enclosed in an iron case (which protects it in a large measure from stray magnetic fields), securely fastened in a wooden carrying box. This box is provided with a hinged cover which protects the scale and binding-posts. Ammeters, having a maximum range of 25 amperes or less, are provided with self-contained shunts. Higher ranges are adjusted to external station type shunts.

Double-scale voltmeters in this type will be furnished, when desired, at the price of \$5.00 additional to the list price of the highest range for each step.

MODEL 45 DC AMMETERS

For all ranges above 25 amperes these instruments consist of millivoltmeters adjusted with external station type shunts to read direct in amperes.

WESTON INSTRUMENTS

Model 370
Dimensions $8 \times 10\frac{1}{4} \times 5\frac{1}{4}$ Inches
Scale Length $5\frac{1}{4}$ Inches

Model 341
Dimensions $8 \times 10\frac{1}{4} \times 5\frac{1}{4}$ Inches
Scale Length $5\frac{1}{4}$ Inches

Weston Portable A.C. and D.C. Ammeter

MODEL 370

These instruments are electro-dynamometer ammeters and may be used with equal accuracy on either direct current circuits or on alternating current circuits of any frequency up to 133 cycles per second and of any wave form.

They are contained in polished mahogany boxes, provided with carrying handles, locks and covers equipped with slip hinges. The weight is approximately 11 lbs. and the dimensions are $8 \times 10\frac{1}{4} \times 5\frac{1}{4}$ inches over all.

They will be found particularly useful as transfer instruments from direct to alternating current and for checking electro-magnetic (movable iron) or induction type instruments, or for all measurements of current where very high accuracy is desired.

Weston Single Phase Portable A.C. and D.C. Wattmeter

Model 310

MODEL 310

These instruments represent the latest development in electro-dynamometer wattmeters and embody many characteristics hitherto considered unattainable in instruments of this class.

They are contained in highly polished mahogany boxes, provided with carrying handles, locks and covers equipped with slip hinges. The weight is approximately 11 lbs. and the dimensions are $8 \times 10\frac{1}{4} \times 5\frac{3}{4}$ inches over all.

SCALES

The scales are $5\frac{1}{4}$ inches long, are uniform throughout their entire length, and are provided with mirrors to prevent parallax errors.

The pointers are of the Weston triangular truss type, with knife edges, and are equipped with simple zero setting devices controlled from the outside of the case.

RANGES

Double ranges for both the current and voltage circuits are provided.

The double current range feature is obtained by connecting the two field coil sections either in series or in multiple by means of links and binding screws, conveniently located on the top of the instrument. These links are provided with handles to facilitate their manipulation and are slotted, making it unnecessary to remove them entirely each time the range is changed.

The double voltage ranges are controlled by means of independent binding posts.

As each instrument has a number of ranges, a scale cannot be made which is readable with equal facility for all ranges. In each case, however, a scale is provided which gives 1, 2 or 5 units per division for the range marked and simple multiplying factors for the other ranges.

See following page for prices.

WESTON INSTRUMENTS

Special Model 310 Wattmeters for Very Low Power Factors

For measurements in circuits where the power factor is very low, such as core losses in transformers, a special line of Weston Wattmeters has been designed, giving full scale deflection for 20% power factor; that is, the scale value in watts is 20% of the number of volt amperes applied.

Model 329

Maximum Volts	Maximum Capacity in Amperes		Watt Ranges		Number of Scale Lines	Price
	Fields in Series	Fields in Multiple	Fields in Series	Fields in Multiple

*These ranges are not compensated and are useful for special conditions only. Correspond before ordering.

Weston Portable Polyphase Wattmeter
MODEL 329

These instruments are contained in highly polished mahogany boxes, provided with carrying handles, locks and covers equipped with slip hinges. The weight is approximately 17½ lbs. Dimensions are 9½ x 10½ x 8½ inches over all.

This form of instrument really consists of two single phase wattmeters, electrically independent, but having their movable coils mounted on a common shaft, so that they rotate together. Each coil, however, moves in its own system of field coils.

SCALES

The scales are uniform throughout their entire length, and are 5¼ inches long.

The pointers are equipped with simple zero setting devices and are of the Weston triangular truss type with knife edges. To prevent parallax errors mirrors are provided.

WESTON INSTRUMENTS

Model 155 Voltmeter

Model 155 Ammeter

Voltmeters and Ammeters

Model 155 Portable

For Alternating Current

These instruments are of the Weston electromagnetic type, in which all the disadvantages and errors of the soft-iron type, previously supposed to be inherent, have been either eliminated or so far reduced as to be practically negligible. The indications of these Weston instruments are accurate within 1 per cent., independent of changes in temperature, frequency or wave form throughout the range of commercial practice. The scales are open and fairly uniform throughout about $\frac{2}{3}$ of the total range of deflection; therefore, the accuracy of reading within the working range is greater than it would be with a uniform scale. The indications are also dead beat and will instantly and accurately follow every change in the value of the quantity being measured.

Leather Carrying Cases

For Model No. 155 Instruments

All ammeters, mil-ammeters and also voltmeters, up to and including 300 volts, provided with leather cases at an additional price of \$7.00. Voltmeters with a range above 300 volts, and not greater than 750 volts, provided with leather carrying cases at an additional cost of \$9.00.

*Delivery F. O. B. Factory, Newark, N. J. For warehouse deliveries write nearest house.

WESTON SWITCHBOARD INSTRUMENTS

Model 11 Ammeter
**Weston Illuminated Dial Station Ammeters, Model 11
 With Shunts**
For Direct Current

The cases for these meters are supplied in two patterns. The one is intended to be attached by means of two brackets directly to and projecting from the front of the switchboard. The other, known as "flush type," is designed to be countersunk so that the front of the instrument is practically flush with the face of the board.

The cases are regularly finished in the following styles, but other finishes will be supplied on special order.

No. 2 finish.—Border of case and face of letters nickel-plated and polished; background of letters and back case dead-black japan. This is a neat and durable finish and one we highly recommend for general use.

No. 3 finish.—Border of front and face of letters nickel-plated and polished; background of letters dead nickel matte; all parts of back case in sight nickel-plated and polished.

Each instrument has one pair of binding-posts to which the shunt leads are to be connected, and another pair for connecting the lamp.

3000	25	270.00	10000	100	550.00

These prices are for No. 2 finish, dead-black japan with nickel trimmings. For No. 3 finish, all nickel-plated, add \$9.00.

These instruments will be supplied for mounting with the fronts flush with the switchboard (designated flush type) when so ordered, at the same prices.

Weston Illuminated Dial Station Model 9 Ammeters (With Shunts)

For Direct Current

These instruments are similar in appearance and are in every respect equal to the Model 11, as regards construction and accuracy. They are, however, of smaller dimensions, and are designed for use in plants where an illuminated-dial instrument is desired, but space is limited.

The cases for these instruments are supplied in two patterns. The one is intended to be attached directly to and projecting from the front of the switchboard. The other, known as the "flush type," is designed to be countersunk so that the front of the instrument is practically flush with the face of the board.

They are regularly supplied in No. 2 and No. 3 finish, as described under Model 11, but may be had in special finishes, at a slight addition in cost.

Model 9 Ammeter

Range in Amperes	Value of Each Scale Division in Amperes	*List Price Each	Range in Amperes	Value of Each Scale Division in Amperes	*List Price Each

These prices are for No. 2 finish (dead-black japan with nickel trimmings).

For No. 3 finish (all nickel-plated), add \$5.00.

*Delivery to G. B. Factory, Newark, N. J. For warehouse deliveries write nearest house.

WESTON INSTRUMENTS

Model 57 Ammeter
Range, 700 Amperes

Model 57 Voltmeter
Range, 120 Amperes

Model 57 Round Pattern Station Ammeters and Voltmeters

For Direct Current

These instruments are made in three patterns. Regular, for front of board connection. Back connection, in which the binding-posts are carried through to the rear of the switchboard. Flush type, in which a flange is provided for the front, allowing the entire body of the instrument to pass through for connection in the rear of the switchboard.

MODEL 57 DC AMMETERS

Range in Amperes	Value of Each Scale Division in Amperes	*List Price Each	Range in Amperes	Value of Each Scale Division in Amperes	*List Price Each
1.....	0.01	\$50.00	300.....	2	\$56.50
5.....	0.05	50.00	400.....	5	57.00

These prices are for No. 2 finish (dead-black japan with nickel trimmings). For No. 3 finish (all nickel-plated), add \$3.00. Any of the instruments in the above list will be furnished with back connections or flush-type cases when specified in order.

*Delivery F. O. B. Factory, Newark, N. J. For warehouse deliveries write nearest house.

WESTON INSTRUMENTS

Models 38 and 39 Duplex Instruments (Direct Current)
Showing a Model 39 Instrument

Weston Duplex Instruments, Model 38 and Model 39

For Direct Current

These instruments are called "duplex" because they consist of a voltmeter and an ammeter combined in one case.

MODEL 39

This model has a well designed and carefully finished aluminum case, which closely surrounds the operative parts. The use of an aluminum case secures minimum weight as well as a much smaller size than is possible with Model 38, and as the case is practically waterproof, this model is well adapted for use where accidental exposure to the weather or to dampness would be likely to occur.

This instrument was originally designed for automobile service, and extreme care has been taken in its construction to enable it to stand without injury the constant vibration to which such instruments are subjected when used on vehicles.

The zero mark on the ammeter scale may be located at any point.

Price of ammeters with scales having zero in center of scale, or in any other part of scale, will be the same as for ammeters of regular constructions of same type with a range equal to the higher reading on the special scale.

The dimensions and weight of this model are as follows:

Length.....	9½ inches.	Height (or Depth).....	3¼ inches.
Width.....	7 inches.	Weight (without Shunt).....	8 lb.

MODEL 38

The interior parts of this model are similar to those used in Model 39, but the scale and pointer are larger. The case is made of cast iron, is not waterproof and does not closely surround the working parts of the instrument. The difference in the size of the case and the material of which it is made necessarily makes the 38 model much heavier than the 39. The dimensions and weight of the 38 model are as follows:

Length.....	11 inches.	Height (or Depth).....	3½ inches.
Width.....	8½ inches.	Weight (without Shunt).....	17 lb.

The Model 38 is well adapted for use where the existence of powerful magnetic fields would render it impossible to use the 39 model. The function of the cast-iron case is to shield the instrument from external fields, and this it does in a most effective manner. In both forms of instruments the workmanship is of the highest grade.

Price List of Models 38 and 39 Instruments

Range for Ampere Scale in Amperes	75 Volts	150 Volts	300 Volts	600 Volts
	*List Price	*List Price	*List Price	*List Price
10.....	\$70.00	\$70.00	\$83.50	\$88.00
25.....	70.00	70.00	83.50	88.00
50.....	70.00	70.00	84.50	89.00
100.....	70.00	70.00	86.00	90.50
150.....	70.00	70.00	87.00	91.50
200.....	79.50	83.50	89.00	93.50
300.....	80.00	84.00	89.50	94.00
400.....	80.50	84.50	90.00	94.50
500.....	82.00	86.00	91.50	96.00

If double scales should be desired in the voltmeter, any ranges below those given in the list will be supplied at an extra charge of \$5.00 in addition to the price for the highest range.

*Delivery F. O. B. Factory, Newark, N. J. For warehouse deliveries write nearest house.

WESTON INSTRUMENTS

Model 159

Weston Eclipse Voltmeters and Ammeters

For Direct Current

These instruments were given the designation "Eclipse" to distinguish them from the well-known moving coil Weston instruments. The designation is also very appropriate as these new instruments represent a distinct advance in the art of instrument design. They belong to the "soft-iron" or "electromagnetic" type, and yet they have none of the many disadvantages and errors commonly associated with instruments of this class. They possess a degree of accuracy and general electrical excellence hitherto wholly unknown, and heretofore deemed impossible of attainment with this type of instrument, and a degree of excellence in mechanical design and construction previously unapproached. The indications are substantially unaffected by temperature changes, whether due to changes in the room temperature or to the heating effect of the current through the instrument. Furthermore, the hysteresis or lag error is entirely negligible at the working part of the scale. This last attainment is unprecedented. Eclipse instruments are made in two models, namely: Model 160 and 159, the only difference being in the dimensions.

Model	Diameter, Inches	Depth, Inches	Length of Scale, Inches

Weston Frequency Meters
MODEL 214

These instruments are of a new type. Their indications are practically independent of changes of temperature voltage and wave form such as may be encountered in the commercial circuits of to-day. All meters are made for one voltage (100 to 125 volts), and for voltage ranges outside of this potential transformers must be used. Every frequency meter is provided with an external box which contains reactors and resistors.

WESTON INSTRUMENTS

Model 151 Voltmeters and Ammeters

For Alternating Current
Dimensions Model 151

Model	Diameter, Inches	Depth, Inches	Length of Scale Arc, Inches
151	9.506	3.150	6.5

These instruments are of the "soft iron" or "electromagnetic" type; however, they have unique electrical and mechanical characteristics, and in these respects they may be said to constitute an entirely new type of instrument. The indications of these instruments are accurate within less than 1 per cent., independent of changes in temperature, frequency or wave form within the range of commercial practice. They are equally as dead beat as the Weston moving coil D. C. instruments, and have scales that are open and fairly uniform throughout about $\frac{1}{2}$ of the total range of deflection.

Voltmeters with a range above 300 volts are provided with external resistance coil.

Every ammeter is tested before shipment for insulation with 4,600 volts for one minute.

The case for each ammeter is provided with a "ground terminal," which must (in order to insure safety to the user) be connected to earth when the potential difference of circuits exceeds 200 volts. When properly erected, the ammeters are perfectly safe for use on circuits operating on a potential difference of 2,300 volts, but must be used with transformers on circuits of higher potential difference. Although there is economy in first cost and a slight advantage in accuracy in so doing, we are not in full accord with the practice of bringing to the front of the switchboard any device directly connected to the high potential circuits.

Transformers must be used on all circuits carrying over 500 amperes, and we recommend a value of 5 amperes for the secondary, and will calibrate the instrument so that it will be direct reading.

 Measuring and Testing Instruments

WESTON INSTRUMENTS

Model 167
Single Phase Wattmeter

Weston Wattmeters

For Direct Current, Single Phase and Polyphase Circuits

These wattmeters have numerous advantages over any type previously built. They may be used with equal accuracy and without change of calibration on direct-current circuits or alternating-current circuits of any frequency, power-factor or wave form within the limits of usual commercial practice. The scale is uniform throughout the entire range of deflection. These wattmeters are made in two models.

DIRECT CURRENT AND SINGLE PHASE WATTMETERS

Model 167

All ranges are back connected. Meters above 300 volts range have external resistance box. For ranges above 750 volts potential transformers are used and for current ranges above 100 amperes current transformers must be used. For use with current transformers the 5-ampere range instrument is recommended. These instruments may also be had in full flush cases for a slight extra charge.

WESTON INSTRUMENTS

Model 216, Full-Front Type,
Polyphase Wattmeter

Model 216, Semi-Flush Type,
Polyphase Wattmeter

Polyphase Wattmeters

Model 216

These instruments have precisely the same characteristics as Model 167. They are regularly furnished with either one of two styles of case, namely: full-front and semi-flush. The semi-flush type projects beyond the front of the board just sufficiently to bring the front of the instrument in the same plane with other Weston A. C. switchboard instruments. Full flush instruments may be had at slight extra cost.

Measuring and Testing Instruments

WESTON INSTRUMENTS

Model 226
Synchroscope

Model 215
Power-Factor Meter

Weston Synchroscope

MODEL 226

This synchroscope is of a distinctly new type. It consists of a phase angle indicator mounted with its pointer behind a ground glass scale and illuminated by a small synchronizing lamp installed behind the pointer and connected to synchronize light. A difference in frequency between two machines causes the pointer to swing back and forth, but owing to the fact that the lamp is lighted only half the time the pointer is seen only during every other swing and thus appears to rotate continuously in one direction. When the machines have the same frequency, but are out of phase, the pointer comes to rest at one side or the other of the middle of the scale. Perfect synchronism is indicated by the pointer remaining at rest in the middle of the scale with the lamp lighted.

The pointer is only visible when the synchronizing lamp is lighted. The indications of the instrument are absolutely infallible.

Every synchroscope includes a lamp transformer, a condenser and a resistor mounted in a separate box. These instruments are made only for one voltage (100 to 125 volts), and when used for other voltages they must be operated with potential transformers. The instruments can be calibrated for any frequency.

Description

*List Price
Complete

Made for 110 to 125 volts and any commercial frequency up to 150 cycles. Specify the voltage and frequency in every case.

\$125.00

Weston Power-Factor Meter

MODEL 215

By virtue of a novel mode of construction the Weston Power-Factor Meter has been rendered practically perfect in its operation. From $\frac{1}{2}$ load to full load it indicates the true phase angle to within 1 per cent. independent of any variable conditions found on ordinary commercial circuits. Polyphase power-factor meters may be used on any commercial frequency. Single phase meters require a phase-splitting device and, therefore, must be calibrated for the frequency at which they are to operate. The following ranges are regularly carried in stock: 25, 40, 50, 60, 125 and 133 cycles per second. Polyphase power-factor meters are arranged for the following systems: two-phase, three-wire; two-phase, four-wire; and three-phase, three-wire. Meters above 300-volt range are equipped with external resistance box. All meters have the same kind of scale, reading from 0.50 lag to 0.50 lead. Special scales for power-factors as low as 0.30 may be had at slight extra cost. This instrument may also be arranged as a sine or cosine meter.

WESTON MINIATURE PRECISION INSTRUMENTS

For Direct Current

Model 267 Switchboard Voltmeters, Ammeters and Mil-Ammeters

This group of instruments consists of a variety of ranges of small switchboard ammeters and voltmeters suitable for use in small isolated lighting plants, small power plants, signal systems, battery charging panels and for all kinds of service where small switchboard indicating instruments are needed.

Dimensions.—Vertical, 3.35 inches; horizontal, 4.1 inches; depth, 1.1 inches.

MODEL 268 SWITCHBOARD VOLT-AMMETERS

These instruments are adapted for use in electrolytic work, charging and discharging small storage batteries, and for service in connection with direct-current ignition systems for gas and gasoline engines, and in all classes of work in which a single instrument is necessary for indicating either potential difference or current.

Triple Range Volt-Ammeter

Model 280 Instruments can also be supplied in the following ranges:

Single range ammeters with external shunts, 50, 75, 100 and 150 amperes, \$30.00 list.

Double range voltmeter with ranges of 15-3 volts, \$29.00 list.

Triple range volt-ammeters with ranges of 15-15-3 amperes and 150-15-1.5 volts, 30-15-1.5 amperes, \$54.00 list.

All portables will be supplied with leather cases when so ordered at an additional charge to the list price of \$3.00.

Dimensions.—Vertical, 4.6 inches; horizontal, 4.4 inches; depth, 1.5 inches.

WESTON MINIATURE PRECISION INSTRUMENTS

For Direct Current

Voltmeter

Ammeter

Model 279—Portable Battery Testers

These instruments consist of a battery testing voltmeter and a variety of ranges of ammeters. They are designed to facilitate the accurate and rapid testing of single cells of storage and other batteries. The voltmeter is provided with a special detachable spike terminal, designed to minimize the time required to make a test. In form it resembles somewhat a speed indicator, and is extremely convenient to manipulate and to read.

The ammeter also has conveniently arranged binding-post, but otherwise it resembles in general appearance the switchboard instruments. The form of the case of both the voltmeter and the ammeter is convenient to hold in the hand, thus adding much to the general usefulness of the instruments.

G. E. Lamp Testing Watt Indicator
Type L

No. 60565

This instrument indicates the watts consumed by the lamp. The plug end of the instrument is equipped with a spring contact end, permitting an extra turn so that the scale may always be in full view.

The instrument is $6\frac{1}{4}$ inches long, $3\frac{3}{4}$ inches wide and $2\frac{1}{2}$ inches deep; it can be easily slipped into the pocket, and is therefore conveniently carried.

The aluminum part of the case is buffed, while the domes are finished in black oxide.

WESTON INSTRUMENTS

**Model 280
Garage Testing Instrument**

Weston Model 280 Garage Testing Instrument

The Weston garage testing instrument is extremely serviceable and will prove of invaluable assistance to the employees in any garage. This instrument is adjusted for ranges of 30 and 3 volts and 100 millivolts, and is provided with external shunts of 3, 30 and 300 ampere rating for use in current measurements. The 30 volt range is useful for determining the voltage of the starting or lighting system or batteries. The 3 volt range is of service in testing the individual storage batteries. The 100 millivolt range may be used to determine the drop over segments of the commutator of the motor or generator. The 3 ampere range is of value in testing the current required by single lights. The 30 ampere range will denote the current required by a complete lighting circuit or the magnitude of leaks. The 300 ampere range is useful to determine the starting current. The foregoing are merely a few illustrative tests to indicate the flexibility and scope of the instrument.

**Model 354
Surface Type**

Weston Model 354 Direct Current Ammeter

The model No. 354 is an excellently made and reliable instrument, designed with a full knowledge of the severe conditions of the automobile service, and if properly installed, will operate successfully on any standard lighting and starting equipment, either one or two unit excepting those in which the charging and lighting circuits are not electrically separated from the starting circuits. The latter systems are those in which the current for starting is passed through the ammeter. The action of the pointer of these instruments is extremely quick and responsive, and at the same time properly deadbeat so that excessive overswing and constant oscillations from any other cause than corresponding changes in the actual strength of the current in the circuit do not occur. In other words, the pointer of the instrument moves instantly in response to every change in the strength of the current flowing in the circuit, and the instrument very correctly indicates the value of such changes. It follows therefore that wherever the spark coil is operated by a battery and the primary of the coil is included in the ammeter circuit, the ammeter will quite accurately respond to the current impulses in the coil, and indicate very closely its true average value. These ammeters are furnished with three styles of cases, i.e.: (1st) flush type with wide flange to be screwed directly to the cowl or dash board. (2nd) front projecting type with back connecting studs serving the dual function of providing a means of making electrical connections and securing the instrument in position; (3rd) flush type narrow flange, which is secured in position by means of a special clamp.

Model 354 ammeters are finished with full nickel or full black finish, but we suggest the nickel finish unless a strong preference exists for the black finish. The model 354 is always furnished with zero in the center of the scale only, and in various ranges for special purposes. The standard ranges for automobile service, however, are 15-0-15 amperes and 30-0-30 amperes. With each meter is furnished a full size templet for drilling or cutting the dash.

SANGAMO AMPERE-HOUR METERS

Standard Type MS Ampere-Hour Meter

Type MS Ampere-Hour Meter with Current Indicator

Type MS Ampere-Hour Meter
For Use with Storage Batteries in Every Service

The almost universal use of storage batteries on automobiles and motorboats, and the increasing use of small electric lighting plants of the Western Electric Hyray type, which makes use of storage batteries, has opened a wide field for the type MS ampere hour meter.

With one of these meters installed, the storage battery user can determine instantly the condition of the battery, and it is of vital importance that an instrument of this type be used, as it results in: Increased life of battery, higher operating efficiency of battery, insurance against absolute discharge of battery, protection against short circuits on battery, insurance against overcharging battery.

Construction. Among the principal features of the type MS ampere hour meter are its compactness and light weight, so that it can be mounted on the dashboard of an automobile, taking up no more room than a clock or a speedometer. It is not injured by the severe shocks or jars incident to operation in automobiles.

All meters in capacity from 15 to 60 amperes inclusive have internal shunts, except those for use on gasoline cars with self-starter systems, in which case a 40 ampere meter, having a small external shunt, is employed. This permits the removal of the meter at any time without interrupting the battery circuit.

All meters of 80 and 100 ampere capacity have external shunts.

Meters may be furnished with back connecting studs or bottom connecting straps.

Application. The regular type MS meter is to be recommended for electric vehicles, isolated plants, signal batteries, etc., where separate ammeters are available for measuring the charging or discharging current. The meter is furnished with a red hand stamped "Empty," which can be set at any desired point as a guide by the user. It also has an insulated contact point at zero, or full charge point, which is closed by a platinum tip on the indicating hand, thus operating a circuit breaker or signal device when the battery is fully charged. Similar contacts may be located by the user to signal certain points in the discharge.

The type MS meter with the current indicator is especially for self-starting systems where no ammeter is used. The current indicator shows whether the battery is charging, discharging or floating, the ampere hour dial indicating the condition of the battery. If accurate current measurement is desired, a standard Weston type 354 auto meter is recommended to be used with the regular type MS ampere hour meter.

DUNCAN WATTHOUR METERS

Direct Current

Model E, Small Size, With Cover in Position

Model E, Small Size, With Cover Removed

Models E and ER

The Duncan Direct Current Watthour Meter has now been on the market for twelve years. Its design has been kept strictly in conformity with the growing demands of the central station. It gives correct registration on loads as low as one per cent. of its normal rating in amperes.

The field coils of model E are traversed by the main current supplied to the translating devices, such as lamps, motors, etc., and the armature is energized by a current proportional to the pressure in volts, and having a resistance in series with it for the purpose of keeping the shunt current as small as possible. The Model ER is of the shunted type and a portion only of the main current traverses its field coils.

Armature. The armature for the various model E meters is wound with No. 40 B&S silk insulated electrolytic copper wire. After being wound they are thoroughly insulated with the best grade of pure grain alcohol orange shellac, then baked at a moderate heat for ten hours. After this they are aged by storing for six months before being assembled in the meters.

Commutator. The commutators are made from hard drawn silver that has a guaranteed fineness of .9995.

Field Coils. They are machine wound with double cotton covered magnet wire and of such a cross section that when the meter is loaded to full capacity, it does not exceed 600 amperes per square inch.

Brushes. The brushes are of the direct tension type of phosphor bronze wires and are provided with silver tips where they make contact with the commutator.

Permanent Magnets. They are made from special tungsten steel and strictly in accordance with a special formula.

Jeweled Bearings. It being imperative that the friction of the main revoluble element, comprising the spindle, worm, commutator, armature, and disk which it carries, be as small as possible, a cupped jewel bearing made from Australian sapphire is used. In the larger sizes of house type meters, that is, above 100 amperes, and all sizes in the switchboard types, a cupped diamond bearing is used.

Light Load Compensating Switch. This switch controls the number of turns in the compensating coil that is situated within the front series field coil, and moving the little lever or arm either cuts in or cuts out turns of the compensating coil. This switch is employed to adjust, when necessary, the meter to accuracy on light load.

See following page for prices.

DUNCAN WATTHOUR METERS

Direct Current

E and ER Continued

Model "E" meters are of the series type, and are made for capacities as shown in the price list. They develop a driving torque or power of not less than 150 millimeter grams, thus continued accuracy is assured. The Model "E" meters are also made with ASTATIC FIELD COILS and ARMATURE in sizes including 25 amperes and larger, and when this feature is wanted, please specify MODEL "EA." For Model "EA" meters the list prices are 10 per cent. higher than those for the Model "E." The Models "E" and "EA," like all Duncan watthour meters, are very simple in design, consequently easily accessible for adjustments and repairs.

Model ER is of the shunted type and is provided with a shunt that is connected in series in the main feeder or line, and having flexible cables that connect it with the field coils of the meter. This arrangement allows only a portion of the main current from the circuit to pass through the field coils of the Model ER, and for this reason it adapts it most admirably for heavy currents, and we are prepared to furnish it for any capacity up to and including 30,000 amperes at either 110, 220 or 500 volts. The armature in the Model ER is slightly different from the armature employed in the other series type models. Its form resembles that of a squirrel cage, instead of the coils being wound around the armature the same as is practiced in the building of a form wound armature for dynamos, and for this reason repairs to the armature are easily taken care of and made at small expense.

DUNCAN SWITCHBOARD WATTHOUR METERS

Direct Current

Model F

Model FR

Models F and FR

Model F meters are of the series type and include sizes from 100 amperes to 600 amperes, 2 wire, and from 100 amperes to 300 amperes, 3 wire. The case or cover for this model is similar to the one provided with the Model "FR" as shown in the cut.

Model FR meters are of the shunted type and include sizes from 100 to 20,000 amperes.

Both Models F and FR have their internal metal parts finished in frosted nickel and are provided with a sheet metal cover having an all glass window in the front only. The cover is given three coats of white enamel on the inside, but the back support and internal mechanism are finished similar to the house type meters. The outside of the case and back support are enameled in plain black which is both neat and durable.

In furnishing Model FR meters we supply them with shunt leads or connecting cables 5 feet in length, so if additional lengths are required, please specify same when ordering, and for which an extra charge is made.

DUNCAN SWITCHBOARD WATTHOUR METERS

Direct Current

Model R Shunted Type Astatic

Model R Glass Cover Removed

Model R

All Model R watt-hour meters are of the shunted type.

They are provided with a neat all plate glass cover; the front of the back support and the magnet shelf are finished in white enamel; the field coils and magnets are finished in hard rubber black, and the rest of the mechanism will be finished in polished copper, polished nickel or hard rubber black and nickel combination. The latter finish will be furnished unless otherwise advised.

Five foot cables are provided with each meter as a standard length and for additional lengths an extra charge will be made.

DUNCAN PORTABLE TEST WATTHOUR METERS

Direct Current

Model HC

Model HC

This meter involves the same theory of operation as all Duncan commutator type direct current watthour meters. The current upon entering the meter is controlled by the cylindrical switch at the rear, and the spring contacts resting against it operate to arrange the windings of the series field coils for the different loads. For example, when the switch is set for minimum load, all of the windings of the field coils are in series, and when the switch is set for maximum capacity, all of these coils are in multiple. This arrangement gives maximum torque for the different capacities, and herein lies the success attending the use of the Duncan Portable Watthour Meter. At the top of the meter and immediately behind the dial is situated the series binding posts, and the handle for the controller switch. Attached to this handle is a marked index which shows the capacity in amperes, and the setting of this index for any desired load is the simplest operation possible. There is also provided a knife switch arrangement for short-circuiting the series field coils of the meter, and is used when changing the load so as to avoid opening the work circuit. For example, before changing from one load to another, this knife switch is closed, then the controller switch is set for the desired load, then after such load has been applied, the short-circuiting switch is opened and permits the current from the work circuit to pass through the series field coils. The dial is the "fly-back" type, as is found in stop watches, and the Duncan Company was the first to employ and embody this novel mechanism in its meters, which allows the meter man to start off from zero with every test.

A heat switch is provided by the use of which much time is saved and the instrument rendered more accurate. By pressing down this switch and giving it a slight turn to hold it in place, the armature of the standard is quickly brought up to operating temperature, thus eliminating errors due to the temperature coefficient of copper.

This instrument is started and stopped by means of a snap switch whose design is such that the potential circuit is always closed except when pressure is applied to the push button. This feature is another aid to accuracy as it keeps the armature from cooling off between runs.

ALTERNATING CURRENT WATTHOUR METERS

Type OA Meter, Metal Cover

Type OA Meter, Glass Cover

Type "OA" Watthour Meter

Single Phase

Westinghouse type OA meters have been developed and constantly improved, with the fact in mind that long-life accuracy and low maintenance cost are features equal in importance to initial accuracy. The permanence of the calibration of these meters results in the least loss of revenue from inaccuracy and entails the least cost for service tests. Their durable mechanical construction minimizes the renewal of parts.

Construction. All parts of the meter element are mounted on a supporting casting and can be removed from the case as a unit without changing the calibration. The moving element is of the disk type, acted on by the electromagnets at one edge and the permanent magnets at the opposite edge. The electro-magnet punchings are in one piece, and shifting of one part with reference to another is thus obviated. They form a closed magnetic circuit, a feature that makes the meter remarkably free from the effects of stray fields.

Case and Cover. The case is of cast iron and covers of pressed zinc with dead black finish, or of glass. The cover is fitted with a dust-proof gasket and the glass windows are sealed. These precautions absolutely prevent the entrance of dust, which would in time cause friction errors.

Terminal Chamber. A separately sealed terminal chamber is provided at the bottom, separated by a dust-proof partition from the meter chamber. As the main cover does not need to be removed at installation, there is no chance for dust entering the mechanism.

Register. The registering mechanism is designed for minimum friction. The four-index dial is of sheet metal painted with a permanent white paint and baked. The dial reads directly in kilowatt-hours, except on the higher capacity meters when a multiplier is indicated on the dial.

Bearings. The main (lower) bearing is a highly polished and hardened steel ball resting between two sapphire cup jewels. The minute gyrations of the shaft give the ball a rolling action which makes a very low coefficient of friction and, by presenting constantly new bearing surfaces, gives an extremely long life. The upper bearing is a self-rolling guide bearing.

Torque and Weight. The ratio of torque to weight in the type OA meters is very high, insuring a long life and freedom from friction errors for long periods.

Connections. Both sides of the circuit are brought into the terminal chamber and the shunt connection is in the terminal chamber. Left-hand feed only is provided.

Adjustments. The ends of the permanent magnet support slide in machined grooves and are each clamped by two screws. This prevents deflecting the magnets in tightening the clamping screws when making full-load adjustment. Micrometer full-load and light-load adjustment can be made from the front of the meter. The only tool required to make adjustments is a screwdriver.

Three-wire meters are identical in appearance with the two-wire. The rated current is that in each outside wire.

See following pages for prices.

Type "OA" Meters for

133 CYCLES

The type OA meters can be supplied for 133 cycle service by the use of a special power factor coil, all other parts being standard. Meters so provided cannot thereafter be used on 60 cycles without changing the power factor coil to the standard one for that frequency.

133 cycle meters will be furnished at the price of the 60 cycle meters, but it should be determined at the time the order is entered whether or not these meters will afterward be changed back to 60 cycles, in which case the extra 60 cycle power factor coils should be ordered and will be supplied without extra charge. These coils can be supplied at any time after the meters are ordered, but under such conditions will be charged for at a nominal price. The change from one frequency to another can be easily made by the customer.

TYPE RO WATTHOUR DEMAND METERS

Glass-Covered Meter

Metal-Covered Meter

Type RO Watthour Demand Meters SINGLE PHASE

The Type RO Watthour Demand is a single meter that records both the kilowatt-hours consumed and the maximum kilowatt demand. The meter is a combination of induction watthour meter, induction wattmeter and an escapement form of time element. All parts are mounted on a supporting casting and can be removed from the case as a unit without changing the calibration. Both sides of the circuit are brought into the terminal chamber and the shunt connection is inside the meter. Left hand feed is provided. The demand mechanism is calibrated by adjusting the position and length of the control spring.

METERS FOR USE WITH TRANSFORMERS

List No. and list price include 5 ampere meter of the voltage listed, for use with transformers, but do not include transformer. When a meter is desired with register reading directly in kilowatt-hours in the primary circuit, it should be ordered as: "Meter similar to List No. (give List No. of 100 volt meter from the following table), except with register for / 5 ampere and / 100 volt transformer"; or "Meter similar to List No. (give List No. of 200, 400 or 500 volt meter from the following table), except with register for / 5 ampere transformer." Price for the meter with register as ordered will be the same as for meter listed. Transformers should be added at regular prices.

Meters for Use With Transformers

List No. and list price include 5 ampere meter of the voltage listed, for use with transformers, but do not include transformers. When a meter is desired with register reading directly in kilowatt-hours in the primary circuit, it should be ordered as: "Meter similar to List No. (give List No. of 100 volt meter from the following table), except with register for..... / 5 ampere and / 100 volt transformer"; or "Meter similar to List No. (give List No. of 200, 400 or 500 volt meter from the following table) except with register for..... / 5 ampere transformer." Price for the meter with register as ordered will be the same as for meter listed. Transformers should be added at regular prices.

Measuring and Testing Instruments

WESTINGHOUSE POLYPHASE WATTHOUR METERS

Alternating Current

Type C Polyphase Meters

Each polyphase meter is virtually two independent meter elements having a common shaft and register.

Standard polyphase meters are furnished with covers of cast aluminum alloy with dial and disk windows. Covers of pressed glass will be supplied with these meters, when so ordered, at same price. Polyphase meters wanted with glass covers should be so ordered.

The number and list price include the meter, with voltage and current transformers, when necessary, ready to connect to the circuit.

Meters for more than 300 amperes per wire require current transformers, and for more than 400 volts 25 cycles or 500 volts 60 cycles voltage transformers.

Meters for three-phase four wire can be furnished self-contained in capacities 5 up to 40 amperes only, also transformer type any capacity.

WESTINGHOUSE SWITCHBOARD WATTHOUR METERS

Alternating Current

Single-phase, Metal Cover

Type C Polyphase Switchboard Meter
Glass Cover

These meters are the same in principle of operation as the single-phase and polyphase house service meters, but differ somewhat in mechanical construction. The registering mechanism is different from the house service styles, having an additional set of gears actuating a long pointer, and the cases are different to adapt the meters for mounting on a switchboard panel.

Covers—Metal covers, cast of aluminum alloy, are of round pattern to harmonize with other switchboard instruments. Meters are also furnished with glass covers built up of rectangular faces held in a metal framework, similar to Westinghouse graphic meter covers.

Transformers—For rated capacities no transformers are required, but for circuits of higher voltages or larger capacities, the 100-volt 5-ampere meter should be chosen, together with the necessary transformers.

When ordering meters other than listed, the current and voltage, or the kilowatt capacity and voltage of the circuit, and the frequency, must be specified.

Measuring and Testing Instruments

WESTINGHOUSE PORTABLE STANDARD WATTHOUR METERS

For Alternating Current—Single-phase and Polyphase

Standard Single-phase Watthour Meter

Portable Standard Watthour Meters

Construction. All parts of the meter element are mounted on a supporting casting and can be removed from the case as a unit attached to the insulating face plate without changing the calibration. The moving element is of the disk type, acted on by the electro-magnets at one edge and the permanent magnets of the opposite edge. The electro-magnet punchings are so clamped as to form one piece, and shifting of one part with reference to another is thus obviated. They form a closed magnetic circuit, a feature that makes the meter remarkably free from the effects of stray fields.

Checking service meters by means of a portable standard watthour meter eliminates the use of a stop watch and makes the calibration very simple. With the desired load on, the number of revolutions made by the meter under test is compared directly with the number of revolutions made by the standard meter in the same time, the result indicating by very simple calculation the error of the service meter. Moreover, as both meters are subject to the same variations, being connected in series, it is not necessary to keep the test load absolutely constant or to measure it with great accuracy.

Accuracy—The meters are carefully tested, and guaranteed to be accurate within 2 per cent. plus or minus, from 2 per cent. of full load to 50 per cent. overload, which overload they will carry continuously without injury.

Testing—The test of service meters should always be made with a standard of corresponding capacity. It is recommended that tests be made at full load and at approximately 4 per cent. of full load. Each standard meter is supplied with a set of flexible leads and a push-button switch. By closing and opening the switch the standard meter can be started and stopped at will.

At full load the large pointer on the dial of the standard meter revolves 25 times per minute and the small pointer once per minute.

Meters of other manufacture may be tested by the Westinghouse portable standard by using the printed instructions and table of constants furnished with each meter. This avoids the expense of having several standards for testing different makes of service meters.

Adjustments—The current and voltage setting of the standard meter is accomplished by means of a drum switch, turned by means of a handle on the face plate. This enables the coils to be connected in series or parallel according to the current and voltage values under which it is desired to test the service meter. Suitable graduations and indices enable this handle to be readily set at any capacity within the meter's range.

Finish—Meters are mounted in a polished walnut carrying case with removable cover.

Manufacturing number and list price cover meter complete with flexible leads.

WESTINGHOUSE GRAPHIC METERS

Type U Closed

Type U Opened

TYPE U SWITCHBOARD AND PORTABLE METERS

These meters are intended primarily for use where small light-weight graphic instruments are desired that are reasonably accurate and that at the same time are comparatively low in price.

Uses. The type U meters are intended primarily for purposes where graphic meters that are easily operated, light in weight, comparatively low in price, and at the same time reasonably accurate, are required. The continuous records of the type U meters, covering a week's time on a single chart, make it possible for central stations to secure at a reasonable cost a number of records much desired but not previously obtained because of the expense.

Arc Light Circuits. One of the most important records for a central station operating series arc lamp is a graphic chart showing the actual time the arc lamps are in operation each night and the actual current supplied to the lamps.

Service Voltage. A graphic meter on the service end of each feeder provides a record of actual conditions. As the type U voltmeter is light and easily set up, it can be transferred weekly or daily from one feeder to another, thus furnishing a number of records at minimum expense.

Customer's Load Curves. A type U graphic ammeter is the simplest means for obtaining the load curve of a prospect's or customer's plant, from which maximum demand, load factor, and diversity factor of the connected load can be quickly determined as a basis of rates. A type U three-wire ammeter is particularly useful for this purpose on three-wire loads.

Station Curves. Mounted on the station or substation switchboard, type U meters will give records of the variation in current and voltage.

Other Uses. Locating leaks and theft of current, determining most economical hours for operating generators of various sizes, checking up the distribution of load between units, and many other uses will suggest themselves to every central station man.

Operation. The meter consists of a solenoid and core acting directly on an arm that carries the recording pen, and a continuous strip of paper moved uniformly by a high grade clock mechanism. The energy consumed by the voltmeter, including its external resistor, is 50 watts. The energy consumed by the ammeter is 7 watts, thus adapting it for use with ordinary current transformers when measuring currents higher than can be passed through the meter directly.

Case. The meter is contained in a metal case having a glass window. The standard meter as regularly furnished is adapted for either switchboard mounting or portable use. A hinged handle at the top makes the meter convenient to carry about, and a lug on the upper end of base is used for hanging the meter on a wall for temporary testing or while being stored in the meter room.

A Glass Ink Reservoir, which will hold a supply of ink sufficient for three weeks or more of ordinary use, is mounted in such a way that a wick, one end of which is in the reservoir and the other in the V-shaped pen, will feed the ink into the pen as used.

The Paper-driving Mechanism is a metal drum with pins that engage in perforations in the record paper, driven through gearing by a standard eight-day clock mechanism. The standard rate of drive is one inch per hour, but meters equipped with a drive mechanism to give a rate of two inches per hour can be supplied on order at the standard price. A two-inch-per-hour mechanism is also listed for changing meters already in use.

Accuracy. The type U meters are most accurate on alternating current, but can be used on direct current when they are calibrated for this service.

TYPE U STANDARD GRAPHIC METERS

The meters are furnished regularly as voltmeters, two-wire ammeters, and three-wire ammeters.

Ammeters. Currents of over 80 amperes can be measured by means of the 5-ampere ammeter in connection with a current transformer of suitable rating. Specially insulated ammeters for connection in arc circuits or other high voltage lines can be supplied at an extra price. Three-wire ammeters record the total current in both outside wires of a three-wire system. They are useful in obtaining a record of the total load on a three-wire installation but are recommended for use on direct-current circuits only. The 5-ampere two-wire meter with a three-wire current transformer is preferable for three-wire alternating-current circuits.

Portable Testing Outfit. This outfit provides a convenient means of measuring currents up to 25 amperes in an overhead line or in the station wiring without opening the circuit. The opening in the transformer for the primary cable or wire is approximately $1\frac{1}{4}$ by $1\frac{1}{4}$ inches. As this opening is not insulated the transformer cannot be used on bare conductor, but the voltage of the circuit on which it can be used is limited only by the insulation on the conductor.

WESTINGHOUSE PREPAYMENT METERS

TYPE OA PREPAYMENT WATTHOUR METERS

Application. The type OA prepayment meter is especially useful when supplying current to small consumers, as it collects the bill and saves bookkeeping. It is also useful when supplying a shifting population, such as at summer resorts, for it saves following up the consumer to collect the bill. Many other uses can also be found for these meters.

Operation. The type OA prepayment meter is arranged to receive quarters, and not only registers the amount of energy consumed, but indicates by an additional dial the number of quarters up to ten remaining to the credit of the consumer. As energy to the value of each quarter prepaid is consumed, the dial changes to indicate one less quarter credited. When no more coins remain to the credit of the customer, the supply is shut off automatically. The coin box will hold \$25 in quarters.

The prepayment mechanism, including the cutout mechanism, is entirely mechanical, operating by gears and levers. The meter is supplied for rates of 5 to 20 cents (full cents only) per kilowatt hour as specified in order. When ordering specify the rate. Meters for other rates can be supplied on special order, prices on application.

Two keys will be supplied to each purchaser with the first meter. Additional keys may be obtained for 40 cents each ret, on personal request of an authorized official.

EXCESS INDICATORS

2 Ampere Flickering Indicator

2 Ampere Flickering and Dimming Indicator. Cover Removed

Excess Indicator or Flat Rate Controller

The Excess Indicator or Flat Rate Controller is an electrically operated instrument used by lighting companies for limiting the wattage in a flat rate contract to a definite contract quantity. It can be so adjusted that even the addition of a 15 watt lamp to a contract load of 150 watts will cause the lamps to flicker until the overload is reduced.

Purpose and Design. It is designed particularly for the control of small lighting loads of from 100 to 200 watts and the most popular instrument is the 2 ampere size. This size is built in two types, one a "flickering" instrument for taking care of light overloads like an extra lamp in circuit, and the other a "flickering and dimming instrument" for taking care of heavy overloads like an electric iron added to the circuit. This instrument operates the same as the regular flickering indicator by causing the lamps to flicker when a small overload occurs, and, in addition, is provided with a dimming resistance which cuts into the circuit automatically and reduces the current supply below the adjusted load when an attempt is made to use a flatiron, whether lamps are in circuit or not.

Indicators of 5 ampere and 10 ampere capacity are also available. These operate on the same principle as the smaller instruments but differ in mechanical construction, due to the greater capacity of the instrument.

Principle of Operation. The Excess Indicator operates on the series solenoid principle. The solenoid has a movable auxiliary armature. When an overload occurs this armature comes up, striking a pin passing through the coil of the solenoid which strikes against the main switch, thus opening the line. In the "flickering and dimming" indicator, when the armature comes up it strikes against a short-circuiting switch, which causes a series resistance to be thrown into the line. These instruments may be adjusted for any desired normal load between 100 and 200 watts. Adjustment to the desired load is made by a thumb-screw which increases or decreases the air gap between the auxiliary movable armature and the pole piece of the solenoid.

The Excess Indicator costs practically nothing to maintain. There is no current loss through the coils and the instrument would be expected to maintain its initial effectiveness without attention over an indefinite period.

VREELAND OSCILLATORS

Laboratory Type Oscillator

Panel Type Oscillator

Vreeland Oscillators

The Vreeland Oscillator is an apparatus for obtaining alternating currents of pure sine wave form and of constant but readily controllable frequency. It is a generator in which a direct current from ordinary supply mains is converted into a sinusoidal alternating current by purely electrical means not involving the use of moving parts.

The chief advantages of this oscillator for the production of currents at telephonic frequencies are:

- 1st. The purity of its wave form.
- 2d. The wide range of frequency which can be readily obtained.
- 3d. Its constancy of frequency with wide variations of load.
- 4th. Simplicity and reliability.

It is especially suitable for use as a source of power in all A. C. bridge measurements. The absence of harmonics permits the use of a telephone receiver in place of a vibration galvanometer or other detector without the use of filters.

This oscillator is supplied in two types; the laboratory type and panel type. The laboratory type shown in illustration is known as type "A," is provided with universal adjustments of frequency current, voltage and mutual inductance of primary and secondary coils. The panel type is a more rugged form which embodies all the adjustments that are usually required, but eliminates some of the more expensive features.

In the laboratory type of apparatus, which is particularly adapted for college and university use, the condenser is contained in the polished mahogany case on which all of the parts are mounted. This condenser has a capacity range of from .1 to 11.2 microfarads in steps of .01 microfarad. With this equipment a frequency range of approximately 250 to 2500 cycles per second may be obtained. The condensers for panel type oscillator are contained in a separate unit, two types of variable condensers being standard for use with this apparatus.

1st. A high grade condenser having a capacity range of from .001 to 39.999 m. f. in steps of .001 m. f. Condensers up to and including 1 m. f. are of high grade mica units, the remaining condensers being of paper. With this equipment a frequency range of from 160 to 4200 cycles per second may be obtained. Satisfactory operation is sometimes possible at a frequency up to and above 6000 cycles per second, but for general work a frequency above 4000 is seldom necessary. The panel type oscillator equipped with this condenser is known as type B.

2d. A cheaper condenser similar to that mentioned above, having a capacity range of from .01 to 19.99 m. f. in steps of .01 m. f. paper condensers are used throughout. With this equipment a frequency range of from 250 to 2500 cycles per second may be obtained. When this condenser is supplied with the panel type oscillator the outfit is known as type C.

For certain classes of work where variable frequency is not required, another form of the panel type oscillator is supplied. This is similar to the other panel type instrument, except that the terminals marked "condenser" are omitted, a fixed condenser being permanently wired into the primary oscillating circuit. This equipment gives two frequencies, one being double the other. The standard frequencies are 500 to 1000 cycles per second. This apparatus is known as type D.

Type	List Price
A Laboratory type instrument having universal adjustments	\$1620.00
B Panel type instrument with high grade condenser	1320.00
C Panel type instrument with paper condenser	1050.00
D Two frequency panel type instrument for 500 and 1000 cycles per second	850.00

WESTINGHOUSE INSTRUMENT TRANSFORMERS

Westinghouse Current Transformers

Current transformers are used for either one or both of two purposes; namely, to reduce the currents to be measured to the relatively small values suitable for measuring instruments or to insulate the meter circuits from the high line voltage. For the latter purpose they should be used wherever the line voltage exceeds 1000. The primary current rating of the transformer should be the same as the full scale reading or rated capacity of the meter to which it supplies current. Current transformers are made in two types—dry and oil insulated.

Dry Type. Current transformers for operation on voltages up to and including 24,000 are of the dry type; that is, the windings are not immersed in oil as in the oil insulated type. Prices on transformers for voltages above 7,500 volts on application.

Oil Insulated Type. Current transformers for operation on voltages above 24,000 are made in the oil insulated type. Prices on oil type on application.

Dry Type A Current Transformers for Three-Wire Service

25 Volt-Amperes Capacity

10 Volt-Amperes Compensation

500 Volts

5 Amperes, Secondary

60 to 133 Cycles

Maximum Line Potential 600

Test Voltage, 5000 Volts for One Minute

These transformers are designed for use with watt-hour-meters on three-wire distribution systems. The primary consists of two separate windings, one of which is connected in each outside wire of the three-wire system and the secondary winding is connected to the watt-hour-meter. When so connected, the watt-hour-meter measures the total output of the system. The ampere rating refers to the current in the outside wires.

These three-wire transformers have a rating of 10 volt-amperes at their rated current and they are designed for circuits in which the maximum potential above ground does not exceed 600 volts.

HARTMANN AND BRAUN FREQUENCY METERS

Switchboard Type

Portable Type

Frequency Meters

These instruments are true precision devices. They are of the vibrating reed type, which type operates on the principle that a steel strip fastened at one end and free at the other end has a natural vibration period and will be set in vibration only when the frequency of the applied impulses coincides with its period, or in other words, when resonance is established. Accuracy is not affected by voltage changes; they are not influenced by variation in wave form; they contain no moving wire; there are no delicate jewels or pivots; they may be left permanently in circuit. In fact, they possess all the advantages and none of the disadvantages of other forms of frequency meters.

SWITCHBOARD TYPE

List No.	Range in Cycles	Value Each Division	No. of Reeds	Diameter of Base	†List Price Each
321817	57-63	$\frac{1}{2}$	13	9 ins.	\$93.60

ELECTRICAL TESTING INSTRUMENTS

MATTHEWS TYPE "C" TELEFAULT

Matthews Type "C" Telefault

Matthews Type "C" Telefault may be used for locating faults of all kinds, excepting "opens," in telephone, telegraph and other multi-conductor cable; also power cables. It may be used for locating metal pipes under ground or within buildings. It may be used for locating concealed wiring. It may be used by Telephone Companies as a tone test set or as a howler to make subscribers hang up their receivers. It can be used on telephone, telegraph and signal cable in place of a galvanometer or loop meter. It requires much less expert knowledge to use it.

Most wireless fault finders use about 45 volts. Matthews Type "A" Telefault used $17\frac{1}{2}$ volts. Matthews Type "C" Telefault uses only 4 volts. The use of high voltage is the cause of "noising up" other working pairs in telephone cable. This feature alone is a decided improvement over any instrument on the market. Matthews Type "C" Telefault, equipped with battery, weighs only 12 lbs. This is about half the weight of any other fault finding instrument.

Matthews Type "C" Exploring Coil is about 50 per cent. more sensitive than the Type "A," which is more sensitive than any other exploring coil on the market.

The tone given out by the Matthews Type "C" Telefault is very much easier to distinguish than that of any other fault finding instrument, because, instead of being a hum, it sounds like a riveting hammer. It can't be confused.

Matthews Type "C" Telefault has a set of known or calibrated resistances, which, if properly manipulated, enables the troubleman to approximately locate the trouble before starting from the office. This saves an immense amount of time, trouble and expense.

Matthews Type "C" Telefault is more efficient for locating pipes than Matthews Telepipe. It has taken its place. Only one dry battery is used. It is held in a neat, strong case, furnished with strong carrying strap and waterproof cover. The vibrator, battery, head phone and exploring coil are all contained in this box.

	*List Price Each

INDICATING INSTRUMENTS

**Matthews Teleheights****Description**

When a tree, telephone line or other obstruction is to be crossed, the usual practice is to send an experienced lineman to judge the height of pole needed. This man estimates the height of the object above the ground, adds what he thinks is the necessary amount of clearance and the distance which the butt is to be set into the ground, and turns in his report of the length of pole required. But when the pole is delivered to the site it is too often found that the estimator has allowed too much margin in order to be on the safe side, and that, say, a 35-foot pole has been ordered where a 30-foot pole would have served; or, what would be a more serious matter, the height may have been underestimated, so that the wires will not clear the obstruction. Such errors on either side of the actual requirements mean waste of material, time and labor.

Having these difficulties in mind, the Matthews Teleheight was conceived by its inventors. This simple little pocket instrument is so designed that an ordinary lineman can sight over the object to be crossed and read directly on a scale, the length of the pole required to give 5 feet clearance when set into the ground at the proper depth.

Use of Teleheight

To use Matthews Teleheight, the lineman measures with a tape a distance of 75 feet from the point which is directly under the object which it is desired to cross. From this distance he sights through the peekhole in the estimator, at the top of the tree or other obstruction. By turning a thumbscrew at the side, he rotates a spirit level until its bubble is seen crossing the line across which he is sighting the top of the object. As soon as the bubble and the object have been sighted together across the line, the pointer will show on a calibrated scale the exact height of the pole necessary to clear the object 5 feet and make an allowance for the proper depth in the ground according to the specifications of the National Electric Light Association or the American Telephone and Telegraph Company. If the former is desired specify Type A, Matthews Teleheight. If the latter, specify Type B. The Type C Matthews Teleheight which give the actual height of an object above the ground is very popular with inspectors for checking up the work of others. The scales have ranges from 25-feet to 75-feet poles.

Type		List Price Each
A	Matthews Teleheight, N. E. L. A., Std.....	\$30.00
B	Matthews Teleheight, A. T. & T. Co., Std.....	30.00

ELECTRICAL TESTING INSTRUMENTS

Queen Volt-Wattmeter

Queen Wireless Test Set

Queen Volt-Wattmeter or Lamp Testing Meter

For demonstrating and checking the Mazda tantalum and carbon filament lamp, and to enable the user to see at a glance the exact wattage, voltage and the cost of using same.

Indispensable to all users of incandescent lamps.

This instrument is an entirely new type of volt-wattmeter, and one which will be extremely valuable to all electricians, testing engineers, lamp salesmen, and any one interested in the testing of line voltages and low wattages. There are but two binding posts, and in ordinary use it reads as a voltmeter. Flush on the side is a lamp socket into which can be screwed an incandescent lamp or an attachment plug and automatically change instrument from a voltmeter to a wattmeter, so that the instrument is then reading directly on the wattage scale. Thus it can be readily seen that this meter comprises two instruments in one, each scale being separate and direct reading without interpolation or reference to a chart.

A cost scale will be added without extra charge if desired, based on a ten cent K. W. rate, making an easy multiple if the rate is more or less. This feature alone will enable the lamp salesman to sell many lamps, as he will be able to show the customer exact cost of running the lamp in comparison to any other type of lamp. At an additional cost an adapter can be supplied to be used for facilitating testing lamps in barrel lots.

Accuracy of Calibration 1 per cent.

Queen Wireless Cable Testing Set

OR INDUCTIVE FAULT FINDER

This instrument is a simple self-contained and inexpensive cable test set used for locating crosses, grounds, split pairs, etc., by means of an exploring coil. Designed and used by a large Bell Telephone Company. Indispensable to all users of telephone and telegraph cables including telegraph and signal departments of railroads. This simple device may be regarded as a "vernier" to the location made with a Wheatstone bridge, and should be placed in the hands of every testman using a bridge set and is also recommended when no bridge sets are used. Its results depend only upon the ability of a man to "listen" and does not involve any mathematical formula. It is also arranged to give a trouble tone.

ELECTRICAL TESTING INSTRUMENTS

Queen Silver Chloride Battery

Queen Low Resistance Ohmmeter

The Chloride of Silver Dry Cell Testing Batteries

The main characteristics of the chloride of silver cell, viz., absolutely constant electromotive force and minute size, render it admirably convenient for testing requirements.

The E.M.F. remains constant throughout the life of the cell, while the temperature coefficient is practically zero for a large range.

The most valuable feature is the entire absence of local action.

During periods of inactivity there is absolutely no deterioration and the life of the battery may be expended at periods ranging from a fraction of a second to the full life limit. It may lie idle for years and then be found instantly available on demand.

The batteries are put up in handsomely finished and serviceable hardwood cases, with pole-changing switch of approved designs except in 12 and 24 cell sizes.

Any number of particular cells may be selected by means of a simple plugging device.

Queen Low Resistance Ohmmeter

Conductivity Bridge

A new direct reading instrument for the accurate measurement of resistance less than one ohm. Readable to .00001 ohm.

Based upon the Kelvin double bridge method, thereby eliminating contact resistance.

This ohmmeter supplies the long-felt want of central stations, telephone companies, electrical manufacturers, electrical departments of railroads, engineers of tests, industrial establishments, etc., for a simplified arrangement for measuring conductor resistances, too small for Wheatstone or slide wire bridges. With the Queen Low Resistance Ohmmeter a thousandth of an ohm is measured with the same ease and facility that ten ohms would be measured on the usual type of ohmmeter or bridge.

List No.		†List Price Each
E-3273	Queen Low Resistance Ohmmeter.....	\$200.00
*E-3274	Queen Low Resistance Ohmmeter.....	350.00

*This instrument resembles E-3273, but is more specifically adapted for conductivity measurements.

ELECTRICAL TESTING INSTRUMENTS

E3116 Queen Combined Lineman's Fault Finder and Ohmmeter

Queen Combined Lineman's Fault Finder and Ohmmeter

This instrument represents the latest developments in a simplified device for locating crosses, grounds and opens in line and cable circuits by the slide wire bridge method, and is also a direct reading ohmmeter for all ranges of resistance from a fraction of an ohm to several megohms. The design is such that accurate results can be obtained by those unfamiliar with the more complete bridge sets, the only operations being arithmetical ones of simple multiplication and division. Plainly lettered switches enable the instrument to be set for the various tests without necessity of memorizing a complicated scheme of connections.

The construction is high grade throughout, one feature being the elimination of the usual straight stretched wires ordinarily used in this class of apparatus. It can also be used for locating "opens," thereby offering in a single instrument all necessary measurements to be made in telephone and telegraph line and cable circuits.

When used as an ohmmeter, the unknown resistances are read directly on the scale, and it is not necessary to refer to a table of values. The ohmmeter circuit is provided with ratio coils, 1, 10, 100, 1000 and 10,000, thereby permitting resistances to be measured to a high degree of accuracy.

When used with the Queen Wireless Cable Testing Set, an ideal combination is offered, since the entire apparatus permits of accurate results by those not necessarily skilled with the use of measuring instruments.

*List Price Each

List No.		
E-3116	Queen Combined Lineman's Fault Finder and Ohmmeter	\$150.00
E-3116A	Queen Lineman's Fault Finder	200.00
E-3117	Sole leather carrying case and shoulder strap for above	16.00

**This instrument is the same as E-3116 except the direct reading ohm scale is not included and the ratio coil has one fixed value of 100 ohms. Unknown resistances are determined by the scale setting and reference to a table of readings supplied with each instrument.

Queen Direct Reading Ohmmeter

This instrument is an improvement in heretofore existing types of direct reading ohmmeters, having a greater range and accuracy, thus making it possible to use these ohmmeters in many instances where it had been necessary to use a complete Wheatstone Bridge.

The instrument is high grade, using the same galvanometer as placed in Queen Portable Testing Sets, which are characterized by high sensibility and a construction enabling them to withstand rough usage. The scale is engine divided on brass and by means of ratios 1, 10, 100, 1000, 10,000, unknown resistances from a fraction of an ohm to several megohms can be measured. Provision is also made for use of external battery in addition to the contained battery.

These ohmmeters are provided with an extra pair of binding posts for connecting a resistance of a different value than the ratio coils supplied. This feature is useful when measuring many resistances of the same value. A sample coil is wound to the correct value and placed in these posts. All other coils when measured in the ohmmeter will balance at mark 1 on the scale if exactly correct, or the scale can be made to read in percentage error. If, for example, allowable error is 1 per cent., the scale index is set to an amount corresponding to 1 per cent. high and the deflection of the galvanometer noted. The index is then placed at 1 per cent. low and the deflection noted. If the deflections are in the opposite direction, the coil is within 1 per cent., but if in the same direction it is without the limit of accuracy. This provision of the extra binding posts also has the advantage of using a coil for the standard having the same wire as the unknown, thereby eliminating any errors due to temperature.

ELECTRICAL TESTING INSTRUMENTS

E-3275 Queen Low Resistance
Fault Finder

E-8000 Queen High
Sensibility Galvanometer

Queen Low Resistance Fault Finder FOR USE BY POWER PLANTS

The location of faults in low resistance lines and cables such as power and feeder circuits necessitates the use of a bridge of special design, so as to practically eliminate contact and lead resistances. The instrument is somewhat similar to E-3273, but with a large sized bridge wire to permit the use of current sufficiently large for satisfactory location and long flexible leads with special clamps to permit connecting to cable terminals in manholes or switches, bus bars, etc.

List No.	*List Price Each
E-3275 Queen Low Resistance Fault Finder.....	\$270.00

Queen New High Sensibility D'Arsonval Galvanometer

This improved design of high sensibility galvanometer has embodied in it all the elements necessary for ease of manipulation, high insulation and high sensibility.

The optical parts, so essential for perfect operation, have received the manufacturers' special attention by reason of their being makers of high-grade optical and engineering equipment. The telescope gives a large and distinct field so as to avoid fatigue when taking a long series of observations.

All parts have been highly insulated, including the leveling screws, so that no false leakage can take place when using a high E.M.F. for testing insulation.

The working qualities of the system provide a galvanometer that is dead beat and quick in action.

The tube containing the system is quickly removable for placing in the magnet a system of different resistance and sensibility, but for most measurements a system of medium resistance will be found to suffice.

List No.	*List Price Each
†E-8000 Queen New High Sensibility D'Arsonval Galvanometer.....	\$135.00
E-8000A Same as preceding, but with telescope and scale.....	180.00
E-8001 Extra tube and system, resistance at option of purchaser.....	63.00
E-8020 Tripod for street use, solid or split leg.....	30.00
E-8021 Carrying case for galvanometer of oak with strap, lock and key.....	30.00
E-8024 Repair kit consisting of extra upper and lower suspensions, screw driver, tweezers...	7.20

†Galvanometer system can also be provided with concave mirror for use with lamp and scale.

E2670 Queen Rail Bond Tester—Complete

Queen Rail Bond Tester

This instrument is arranged to measure the resistance of a jointed conductor, the value of the resistance being indicated in the equivalent number of track feet. The contacts for the rail have been most carefully designed so as to insure reliability. The bar carrying the contacts are pressed down against the rail by the operator's foot, and the scale readings are noted by the same operator. The scale range can be calibrated to meet user's requirements.

List No.	*List Price Each
E-2670 Queen Rail Bond Tester, complete.....	\$160.00

*Delivery F. O. B. Factory, Philadelphia, Pa. For warehouse deliveries, write nearest house.

QUEEN PORTABLE GALVANOMETER AND SHUNT

E-8058 Queen Portable Galvanometer

E-8808A, etc., Queen-Ayrton Shunt

Queen Portable Galvanometers

These instruments are of the D'Arsonval type, unaffected by surrounding magnetic fields or neighboring circuits. Their characteristic is high sensibility and immunity from derangement even under conditions of severe use. The sensibility is such that 1 volt through 1 megohm will produce deflections of 1 scale division. The deflections are proportional to the current and the scale has 30 divisions each side of the center. The glass covering the scale is in the form of a lens, so as to magnify the deflection. This feature enables these galvanometers to be used in commercial measurement where heretofore it was considered necessary to use a reflecting type. A zero adjustment is provided of such design as to eliminate the possibility of derangement. Useful for supplementing old style galvanometers in testing sets, insulation testing and the detecting of circuits where sensibility is required.

List No.		*List Price Each
E-8058	Queen Portable D'Arsonval Galvanometer	\$28. 80
E-8060	Queen Portable D'Arsonval Galvanometer in case with lid and carrying handle	40. 00
E-8062	Same as E-8060 with six silver chloride cells	63. 00

Note: Any of the above galvanometers can be supplied with Ayrton shunts attached.

Queen Portable Galvanometer for Insulation Testing

This galvanometer is similar to E-8060, but has an Ayrton shunt of values 1, .1, .01, and .001 and a standard resistance for calibrating the galvanometer scale. It is intended for the measurement of insulations where a higher priced galvanometer outfit is not required. The manipulation is such as to simplify the ordinary calculations for insulation measurements. Can be used on 110 V.D.C. circuits or battery, and has range from 10,000 ohms to 100 megohms.

List No.		*List Price Each
E-8065	Queen Portable Galvanometer for insulation testing	\$135. 00

Galvanometer Shunts

These shunts are of the Ayrton universal type and can be used with any galvanometer regardless of the galvanometer's resistance. This type of shunt is also accurate for ballistic measurements. The dial type of switch used is similar to that employed in the Queen Dial Decade Testing Sets and is more convenient than plugs. The total resistance of shunt should not be too great as compared with that of the galvanometer and in consequence the following sizes are listed. Each gives 1, .1, .01, .001 and .0001 of full current through the galvanometer.

List No.		*List Price Each
E-8808A	Ayrton Universal Shunt	\$72. 00
E-8808B	100,000 ohms; for galvanometers 3000-10,000 ohms. Ayrton Universal Shunt	54. 00
E-8808C	30,000 ohms; for galvanometers 1000-3000 ohms. Ayrton Universal Shunt	49. 50
E-8808D	10,000 ohms; for galvanometers 500-1000 ohms. Ayrton Universal Shunt	40. 50
	3000 ohms; for galvanometers 100-500 ohms.	

*Delivery F. O. B. Factory, Philadelphia, Pa. For warehouse deliveries, write nearest house.

QUEEN PHOTOMETERS

Station Type

Queen Station Type Photometer

It consists of a regular angle iron tracks with direct reading candle power scale and an adjustable support at one end for the standard lamp and at the other end for lamp under test. Provision is also made so that the lamp under test can be rotated to secure mean horizontal measurement, the motor for this purpose not being supplied but all the attachments to hold the lamp are present. An ordinary fan motor will answer the purpose admirably. Metal end screws are provided and a very sensitive Bunsen sight box. The construction is first-class throughout, and all the necessary binding posts for connection of the different instruments are supplied. There is also furnished one carefully standardized incandescent lamp. Scale reads from 1.5 c.p. to 800 c.p.

For greater sensibility the Bunsen sight box can be replaced by the Lummer-Brodhun. Readings to one-tenth candle power can then easily be made.

The distance between centres is 100 inches, thereby providing ample sensibility.

List No.		*List Price Each
E-4020	Station photometer as above.....	\$180.00
E-4025	Station photometer with brackets for attachment to wall.....	190.00
E-4026	Station photometer with Lummer from the wall, Brodhun box instead of Bunsen, but no electrical attachments.....	250.00

Commission Type

Queen Commission Type Photometer

Strong construction and arranged for permanent installation by setting on a table or by brackets of the wall.

The distance between centres is 60 inches. It is equipped with a Bunsen Sight Box, metal screen direct reading candle power scale and a standard incandescent lamp.

List No.		*List Price Each
E-4028	Commission photometer.....	\$100.00

Correspondence solicited regarding all photometric equipment.

*Delivery F. O. B. Factory, Philadelphia, Pa. For warehouse deliveries, write nearest house.

ELECTRICAL TESTING INSTRUMENTS

Portable Bond Tester

Portable Bond Tester

This instrument is rapid and accurate. One man can use it. Compares 3 ft. of bonded rail with 3 ft. of unbroken rail and reads direct in equivalent length of unbroken rail. Ordinarily uses current in rail and accuracy is independent of amount of current, this influencing sensibility only.

For places where current in rails is small or intermittent, or for new construction, a special high sensibility model is furnished, current being obtained from portable storage batteries. To operate the high sensibility model two men are required.

The contact bar carries renewable saw blade contacts which will not fail to make good contact. The bar may be folded for more easy transportation.

Operation

In operation, the section of the bar marked "Bond" is made to span the joint. The central button is then rotated until the galvanometer needle at the top comes to 0. The rotated needle then indicates directly on the scale, the length of rail to which the bonded section is equivalent.

List No.	Description	Weight Lbs.	*List Price Each
321839	Standard sensibility type Bond Tester.....	6	\$136.00
321840	High sensibility type Bond Tester.....	6	170.00

Size closed $5\frac{1}{4} \times 8\frac{1}{4} \times 7\frac{1}{2}$ inches.

Portable Ohmmeter

A most convenient instrument for all ordinary resistance measurements and extremely simple to operate. Close readings are obtainable, there being 4 ranges, each on a scale 30 inches long.

An unknown resistance is measured by connecting it to points XX. The plug is inserted in one of the sockets marked "brown, blue, red, black" and the toucher tapped along the wire that runs from end to end of the scale. At a certain point there will be no sound in the telephone (or no deflection in the galvanometer). The resistance is then read off the scale, using figures of color corresponding to the socket. If the first test indicates that a closer reading could be obtained with another range, it is only necessary to change the plug to another socket and find point of silence as before.

There are no loose parts, except two additional scales to lay over regular scales in testing for grounds and crosses. Batteries are supplied in compartment in bottom and are readily renewable. In order to prevent waste of batteries a key is provided, conveniently located in the telephone receiver.

TELEPHONE TYPE

This type has the telephone receiver only as a means of finding the point of balance, and is often preferred for its simplicity. It is like cut if the lever switches, galvanometer dial and coil in cover were omitted.

List No.	Description	*List Price Each
321841	With 4 scales, 10, 100, 1,000, and 200,000 ohms.....	\$76.50
321842	With 4 scales, 10, 100, 1,000, and 2,000,000 ohms.....	85.00

GALVANOMETER TYPE

The galvanometer type is useful where noise makes telephone readings difficult. It is also more sensitive than the telephone. The induction coil is for the purpose of converting instrument into a Kohlrausch bridge for measuring resistance of electrolytes, and comparison of inductances and capacities. In addition, this type has all features of telephone type.

List No.	Description	*List Price Each
321843	With 4 scales, 10, 100, 1,000 and 200,000 ohms.....	\$102.00

Measuring and Testing Instruments

ELECTRICAL TESTING INSTRUMENTS

Peerless Portable Insulation and Capacity Testing Outfit

Test Unit

Outfit Packed for Field Work

Consists of Peerless galvanometer, of the High Sensibility type, test box and tripod.

Galvanometer. Any sensibility up to 1600 megohms, and any coil resistance from 30 ohms to 2000.

The separate units required for the measurements of insulation and capacity are combined in a polished oak case, highly insulated rubber top, size 8 x 11 x 2 1/4 inches.

The main test switch has studs for "Cable," .1 megohm and .1 M. F.

The Universal Ayrton shunt has values of 1, .1, .01, .001.

All coils in test box accurate to 1/25 of 1 per cent.

Standard condenser accurate to 1/4 of 1 per cent.

Special short circuit key can be used as a permanent short circuit by depressing the knife-blade contact on one side, or used as a tapping short circuit, by tapping with the finger on the other side.

"Set-test" key makes contact in knife-blade contacts for insulation or capacity tests.

Test key has points of charge, insulate and discharge.

The insulation throughout is extremely high, of the corrugated pillar form, and is extended entirely through the rubber plate, and has as much below as is shown above, thus eliminating any possible chance of any leakage.

Artificial Lines and Cables

These instruments are made up in various subdivisions of their total length, and are made to represent various sizes of wire in telephone and telegraph use. The standards are 1-mile, 5-mile, 10-mile and 32-mile cable, which represents the equivalent of 32 miles. No. 19 B. & S. gauge wire has a loop resistance of 88 ohms per mile and a capacity of .060 M. F. per mile.

Experience in the manufacture of these cables extends over a considerable period of time, and we are prepared to furnish promptly standard sizes or special sizes to meet requirements. This is a line of apparatus which is made up strictly on order and is not usually carried in stock on account of the varying conditions, and we solicit the correspondence of those interested and who desire full particulars and the prices on these cables.

ELECTRICAL TESTING INSTRUMENTS

Peerless Fault Finder

Peerless Inductive Fault Finder

Peerless Improved Lineman's Fault Finder

This instrument is used for measuring resistances and locating crosses, grounds, opens and other cases of line and cable troubles.

The unknown resistances are read directly from the scale, thereby avoiding the additional operation of referring to a table for values.

List No.		*List Price Each
T-2062	Peerless Improved Fault Finder.....	\$144.50
T-2063	Sole leather carrying case.....	18.00

Peerless Inductive Fault Finder

This fault finder is used principally for locating wire troubles, such as are found in telephone cables, conduits and similar troubles. The outfit is extremely simple, and directions for its use are on a printed card, which is fastened to the inside lid of the set, so that any one entirely unacquainted with this method of testing can in a few minutes make the test required without having any previous experience. It is an inexpensive but handy accessory to any telephone company, and wherever one has cable to be maintained and where it is desired to locate trouble quickly and accurately, these will be found very useful and will pay for themselves in a very short time.

ELECTRICAL TESTING INSTRUMENTS

Government Standard Testing Set

Portable Plug Set

Government Standard Testing Set

Government Standard Testing Set, made in strict accordance with the rigid requirements of the United States Navy Specifications 17-T-2. A high-grade type of "Plug-In" set.

Battery consists of 6 silver chloride cells.

Bridge values in the A and B arms, 1, 10, 100, 1000, and coils are accurate to 1/20 of 1 per cent.

Rheostat on the decade plan, with 10 coils in each decade, of the values of units, tens, hundreds and thousands.

List No.		*List Price Each
T-2070	Peerless G. S. decade portable testing set.....	\$200.00
T-2085	Carrying case of sole leather, with shoulder strap.....	18.00

Peerless Portable Plug Set

Bridge coils in A arm of the values of 1, 10, 100, accurate to 1/20 of 1 per cent. Bridge coils in B arm of the values of 10, 100 and 1000, accurate to 1/20 of 1 per cent. Bridge arms reversible.

Rheostat coils are of units, tens, hundreds and thousands, and are of the multiples of 1, 2, 2, 5 of each denomination, a total of 11,000 ohms, and by using the 1 to 1000 ratio on the bridge, gives a range of 11 megohms in single ohm steps. Accuracy of the rheostat coils 1/10 of 1 per cent.

Provision for outside battery, in case higher E. M. F. is required than that furnished in the cells in the set.

This set is especially designed for ease in reading. The bridge is at the top, out of the way of the tester, and the plugs are in vertical columns, beginning with the thousands at the left hand side and followed by the hundreds, tens and units, so that when balance is obtained one reads the value of the resistance plugged out, the same as reading a column of figures.

The finish of this set is the same as the Peerless Switch Dial Set.

Weight, 7½ pounds. Size, 8½ inches x 5½ inches x 6 inches.

List No.		*List Price Each
T-2010	Peerless plug type testing set.....	\$120.00

ELECTRICAL TESTING INSTRUMENTS

Switch Dial Set

Switch Dial Set. Large Type

The Peerless Switch Dial Test Set

Bridge arms have values of 1, 10, 100 and 1000 in each arm, and the coils are accurate to 1/20 of 1 per cent.

Rheostat has four dials of 10 coils each, of the values of units, tens, hundreds and thousands, and the coils are adjusted to an accuracy of 1/10 of 1 per cent.

Ayrton shunt in set as part of the apparatus.

Provision for outside galvanometer and outside battery.

Special designed switch, with negligible contact resistance.

Commercial cells used in batteries are obtainable in any supply house.

Quick make and break switches for changing from test to test.

Weight, complete, 7¾ pounds. Size, 9½ inches x 5¼ inches x 5½ inches.

Finish of wood work, highly polished mahogany; finish of metal work, polished brass, gold lacquered.

List No.		*List Price
T-2000	Peerless Switch Dial Decade Testing Set.....	\$170.00
T-2015	Sole leather carrying case for T-2000.....	18.00
T-2020	Flexible contact clutches for gripping heavy conductors.....	9.00

TESTING INSTRUMENTS

Plug Type Resistance Box and Wheatstone Bridge

Ayrton Shunt

Plug Type Resistance Box and Wheatstone Bridge

The resistance units in the rheostat are adjusted to an accuracy of 1/10 of 1 per cent. and the bridge arms to 1/20 of 1 per cent. These are built on the well-known post office plan, and are very satisfactory for ordinary testing work. The coils are carefully treated and aged, and are wound on wooden spools. The plugs are carefully made to an exact taper, and will fit in the plug holes smoothly, with practically no contact resistance. The line posts are of a double-grip type, for gripping small or large sized wire, and all binding posts are of a substantial size throughout.

List No.	Description	*List Price Each
T-1550	Resistance box and Wheatstone bridge. Resistance coils 1, 2, 2, 5, 10, 20, 20, 50, 100, 200, 200, 500, 1000, 2000, 2000, 5000; ratio coils—A arm 1, 10, 100 and 1000; B arm 1, 10, 100 and 1000; supplied with battery and galvanometer keys, galvanometer key having a short circuit strap	\$68.00
T-1552	Resistance box. Resistance coils of 1, 2, 2, 5, 10, 20, 20, 50, 100, 200, 500	34.00
T-1554	Resistance box, similar to the above, except coils of 1, 2, 2, 5, 10, 20, 50, 100, 200, 200, 500, 1000, 2000, 2000, 5000	51.00

Universal Ayrton Shunt

The Universal Ayrton shunt is designed for any galvanometer, and is not dependent upon the resistance of the instrument used. The shunt is made with switch contacts, the sliding contact being carefully ground, and is absolutely smooth and of a negligible resistance. The brush is of the finest grade of spring phosphor bronze, of a number of laminations, and of a design which is entirely new, which gives a uniform spring contact both on the arm running over the block, and also on the center ring. The contact surfaces of the brush are set at an angle, so that in swinging over the blocks it does not mar or line them, and the contact surface of the brush on the center stud is equal to the contact surface on the studs. Thus on all switches the contact surfaces are equal. These shunts are made in three sizes, and can give .1, .1, .01, .001 and .0001 of the full current through the galvanometer.

List No.	Description	*List Price Each
T-3000	Ayrton Universal shunt of about 100,000 ohms, for galvanometers having resistance of 3000 to 10,000 ohms	\$68.00
T-3005	Ayrton Universal shunt of about 20,000 ohms, for galvanometers having resistances of 1000 to 3000 ohms	51.00
T-3010	Ayrton Universal shunt of about 10,000 ohms, for galvanometers having resistances of 500 to 1000 ohms	63.76
T-3015	Ayrton Universal shunt of about 3000 ohms, for galvanometers having resistances of 100 to 500 ohms	38.26

 Measuring and Testing Instruments

TESTING INSTRUMENTS

No. T-9025. Standard Mica Condenser

Resistance Box

Standard Mica Condensers

No. T-8000. Condenser is made of standard grade of mica, and is accurate to $\frac{1}{4}$ of 1 per cent. and will stand a continuous alternating E.M.F. of 250 volts. The case is of polished mahogany, with a highly polished hard rubber top, and metal parts lacquered.

No. T-8005, T-8010, similar to T-8000.

No. T-8025 is a subdivided condenser. This allows the sections to be used in series, as well as parallel combinations, and all values can be obtained from .05 up to .1 M.F.

Nos. T-8060, T-8065, T-8070, and T-8075 are furnished where a cheaper mica condenser is desired. They are of a very good grade of mica, mounted in hardwood cases, neatly finished, and adjusted to an accuracy of 1 per cent.; and capable of withstanding voltages of 250 volts alternating current.

List No.		*List Price Each
T-8000	.3 M.F. single value.....	\$42.50
T-8005	$\frac{1}{2}$ M.F. single value.....	42.50
T-8010	.1 M.F. single value.....	68.00
T-8025	.1 M.F. subdivided of .05, .2, .2, .5.....	102.00
T-8060	.1 M.F. capacity.....	14.46
T-8065	.2 M.F. capacity.....	21.42
T-8070	.5 M.F. capacity.....	30.60
T-8075	.1 M.F. capacity.....	44.20

Standard Resistance Boxes

The construction of these boxes throughout is the best. The segments are highly insulated on hard rubber above the regular hard rubber top furnished, which gives a very high insulation. The regular box supplied with most outfits is of one value mounted in a polished mahogany case, hard rubber top, with strap to short-circuit same. We can also furnish subdivided types in both switch and plug styles. In the megohm box there are six pillars, with extra insulation, and the binding posts are double, so they may be connected with links if desired.

List No.		*List Price Each
T-1000	Resistance box, 100,000 ohms single value.....	\$59.50
T-1005	Resistance box 100,000 ohms, in four units, 10,000, 20,000, 30,000 and 50,000 ohms..	85.00
T-1020	50,000 ohms single value in hard wood case, with rubber top, with 2 terminals on hard rubber.....	42.50
T-1025	250,000 ohms consisting of five groups of coils of 50,000 ohms each, same style mounting as T-1020.....	127.50
T-1030	500,000 ohms same as T-1020, but 100,000 ohms in each group.....	170.00
T-1035	Megohm box same as T-1020, but 200,000 ohms in each group.....	255.00

LEEDS AND NORTHRUP TESTING SETS

Type S No. 5300

No. 5400

Type S Dial Decade Portable Testing Set

This instrument has been brought out in response to a definite demand for a portable testing set combining the features of compactness, light weight, ease of operation, accuracy of adjustment and moderate cost.

The instrument is adapted to resistance measurements within the range of the Wheatstone bridge. By means of two small, but substantial, double throw switches, the internal connections are changed for the Murray or Varley loop tests, used in locating grounds, crosses, etc., on lines and cables. The set may also be used in locating broken wires.

The set measures, when closed, $7\frac{7}{8}$ inches x $8\frac{3}{4}$ inches x $4\frac{1}{2}$ inches, and weighs but eight pounds.

The rheostat coils are adjusted to an accuracy of $1/10$ per cent. and the ratio coils to $1/20$ per cent. All resistance coils are wound upon metal spools. The dial contacts are carefully designed and no fear need be felt that errors will be introduced due to poor contacts. The dial switches revolve continuously in either direction.

The galvanometer is of a new type, the sensitivity being guaranteed to be one megohm or more. The system of this galvanometer is removable, facilitating repairs should any damage be done to the moving system.

The dial construction is of a new type. All dial contacts are inside of the box, and thus protected against dust and dirt. The ratio arms are controlled by a single dial, thus facilitating the manipulation of the instrument, as in those instruments in which two dials are used there is sometimes confusion as to whether the ratio is a certain value or its reciprocal.

5300	Type S Dial Decade Portable Testing Set.....	\$120.00
5301	Leather carrying case for 5300.....	14.00

No. 5400 Dial Decade Portable Testing Set

This is a high-grade portable testing set for the measurement of resistance and the location of grounds, crosses, opens, etc.

The dials revolve continuously in either direction. The bridge arms are controlled by one dial which simplifies manipulation. The changes of internal connections are made by means of small knife switches plainly marked. All resistances are wound upon metal spools. The ratio coils are guaranteed accurate to $1/20$ per cent. and the rheostat coils to $1/10$ per cent. The overall dimensions of the set are $6\frac{1}{4}$ inches x $10\frac{1}{4}$ inches x $14\frac{1}{4}$ inches, and the weight is $15\frac{1}{2}$ pounds.

The galvanometer in the instrument is guaranteed sensitive to one megohm or over, and is of a new type in which the system is easily removable, facilitating repairs, should they ever be necessary.

LEEDS AND NORTHRUP TESTING SETS

Testing Galvanometer

Portable Galvanometer

Portable Insulation Testing Galvanometer

A new form of portable insulation testing galvanometer. The sensitivity of the galvanometer is high, one volt through a resistance of 20 megohms or more causing a deflection of one scale division. It is strictly portable and will withstand as much rough usage as an ordinary voltmeter.

The resistance of the coil is about 225 ohms and the period two seconds.

The instrument is provided with an Ayrton shunt, and a standard 100,000 ohm resistance for use in insulation measurements. The entire instrument is carried in an oak box, measuring 9 inches x 4 inches x 4 inches, and it weighs complete 6 pounds.

In the illustration the telescope and scale are shown in position for use. The telescope is pivoted at the bottom and when the box is to be closed it is laid in a position parallel to the long axis of the box. The box is made long enough to allow this to be done without altering the focus of the telescope. The scale is held in an aluminum frame, which is mounted upon the lid of the box, when open, by means of a pin on each side. When the box is to be closed, the scale is lifted from this position and placed within the box.

The moving system of this galvanometer is contained as a separate unit and may be easily removed, facilitating repairs, should they ever be necessary.

List No.		*List Price Each
5378	Portable Insulation Testing Galvanometer.....	\$153.00
2400	Galvanometer only, without Ayrton shunt and 100,000 ohms resistance.....	117.00

Portable Galvanometers

This galvanometer is at once completely portable, robust, quick and sensitive. It embodies a new design, into which has entered not only the practical experience of years of manufacture, but also the theoretical considerations which recent investigations have developed. This design has resulted in a galvanometer with remarkable characteristics.

It is portable and will stand rougher usage than an ordinary voltmeter.

The current from one volt through a resistance of 1,000,000 ohms will cause the pointer to move one millimeter over the scale. Its normal period is about three seconds. As usually constructed, it will be critically damped on an external circuit of 100 to 150 ohms.

The overall dimensions are 5 inches x 3 inches x 4¼ inches.

The system is easily removable, facilitating repairs, should they ever be necessary.

List No.		*List Price Each
2320	Portable Galvanometer.....	\$30.00
2322	Portable Galvanometer, in case with lid.....	37.52

LEEDS AND NORTHRUP TESTING SETS

Nos. 2164 to 2167
Galvanometer Shunts

No. 4250
Resistance Box and Wheatstone Bridge

Galvanometer Shunts

These shunts are of the Ayrton Universal type, and can be applied to any galvanometer, not being dependent upon the instrument's resistance.

List No.		*List Price Each
2164	Ayrton Universal Shunt of about 100,000 ohms, for galvanometers of 3000 to 10,000 ohms.	\$72.00
2165	Ayrton Universal Shunt of about 30,000 ohms, for galvanometers having resistance of 1000 to 3000 ohms.	54.00
2166	Ayrton Universal Shunt of about 10,000 ohms, for galvanometers of from 500 to 1000 ohms resistance.	49.50
2167	Ayrton Universal Shunt of about 3000 ohms, for galvanometers of 100 to 500 ohms.....	40.50

100,000 Ohm Resistance Boxes

The 4245 instrument is of the round type mounted in a brass box, with hard rubber top. The connections should be made to terminals marked 3 and 4. When the flexible cord is on plug 1 the box is short-circuited, but when on plug 2 the resistance of 100,000 ohms is in series. The box is especially suited to rapid cable testing.

No. 4246 is in four units of 10,000, 20,000, 30,000 and 40,000 ohms. An infinity plug separates each coil from the one next to it. Segments are elevated from the hard rubber top by special washers in order to increase insulation. Binding posts are so arranged as not to be in the way when plugs are used, a common defect of square pattern sets.

List No.		*List Price Each
4245	Resistance Box, 100,000 ohms.....	\$63.00
4246	Resistance Box, 100,000 ohms.....	90.00

Resistance Boxes and Wheatstone Bridges

Post Office Pattern

In this line of resistance boxes the older post office scheme for the arrangement of the coils and blocks is used. These instruments are thoroughly well made. The blocks and binding posts are large and fastened firmly upon the rubber plate. An important feature of the blocks is their generous height, which makes possible a good plug bearing. The plugs are carefully made and the heads will not come off. Good plug fit is guaranteed. In the Wheatstone bridge keys are provided in both the battery and galvanometer circuits. All internal connections are traced in white upon the tops of the instruments.

The resistances of the rheostat are adjusted to an accuracy of 1/5 per cent., and those of the ratio coils to 1/10 per cent. The temperature coefficient of the wire is so low that no correction is necessary. The coils are all wound upon metal spools, are well aged and will not change appreciably with time. In these sets the rows of blocks are spaced well apart so that the plugs can be conveniently manipulated.

List No.		*List Price Each
4250	Resistance Box and Wheatstone Bridge.....	\$64.00
	The rheostat coils are 1, 2, 3, 4, 10, 20, 30, 40, 100, 200, 300, 400, 1000, 2000, 3000, 4000.	
	The ratio coils (non-reversible) are 1 10, 100, 1000, in one arm, and 1, 10, 100, 1000 in the other arm.	
4252	Resistance Box.....	42.00
	This box contains the coils 1, 2, 3, 4, 10, 20, 30, 40, 100, 200, 300, 400, 1000, 2000, 3000, 4000.	
4254	Resistance Box.....	32.00
	Same as 4252, but with the following coils, 1, 2, 3, 4, 10, 20, 30, 40, 100, 200, 300, 400.

BRISTOL INSTRUMENTS

Switchboard Type

Portable Type

Recording Voltmeters

These Recording Voltmeters are made for use with 12 inch, 8 inch and 6 inch charts. Instruments can be supplied for direct current, alternating current and also for use interchangeably on alternating and direct current. Standard finish of switchboard instruments is nickel plate, but instruments to match any other finish furnished at same prices. Front connections furnished unless otherwise ordered.

24 hour chart furnished unless otherwise ordered.

Orders for alternating current should specify frequency.

Charts have increasing graduations, hence best working range is above one-half capacity of meters.

The above wattmeters must be used with transformers where potential exceeds 125 volts or current exceeds 5 amperes.

Single phase wattmeters require one potential transformer with secondary of 125 volts and one series transformer with secondary of 5 amperes.

Prices of transformers on application.

Directions for Ordering Bristol's Recording Wattmeters for Alternating Current

Orders for Bristol's Recording Wattmeters for use on alternating current, single phase, balanced two-phase or balanced three-phase systems, should specify the following:

1. Manufacturer's number of instrument.
2. Number of chart taken from the list below.
3. Maximum number of kilowatts to be recorded.
4. Maximum number of amperes on each phase.
5. Maximum number of volts on each phase.

†Delivery F. O. B. Factory, Waterbury, Conn. For warehouse deliveries, write nearest house.

BRISTOL INSTRUMENTS

Recording Shunt Ammeters

Recording Shunt Ammeter

These instruments are equipped with movements made by Weston Electrical Instrument Company. The recording arm does not drag on the surface of the chart, but swings clear in front of it. The surface of the chart is smoked and is sensitive and semi-transparent. The pointer is brought in contact with the chart every 5 seconds, by means of a mechanical vibrator, and the record produced is actually a series of dots which appear as a solid line. These instruments are for circuits on which the load is fairly steady. Prices on instruments with mechanical or electrical vibrator for rapidly fluctuating loads on application.

Charts listed below are for 24 hour records.

List prices of Wm. H. Bristol Recording Shunt Ammeter, black enamel finish, nickel raised parts, model 637, with Weston Milli-Voltmeter Movement, for use with 8 inch charts; patent semi-transparent smoked chart recording system, complete with flexible duplex leads 50 feet long, 100 patented smoked charts and fixative solution, for use in connection with the standard shunt (price does not include shunt).

PATTERSON TEST SETS

No. TS-49

Cartridge Cell
Unit with Screw-TopPhantom View Showing Screw-
Top Cell Construction
Cartridge Cell Type

Patterson Cartridge Cell Test Sets will appeal to every electrical engineer who has occasion to use a test set.

Regularly furnished with two sizes of cells as follows: $2\frac{1}{4} \times \frac{3}{4}$ inch diameter and $2\frac{1}{4} \times 1$ inch diameter.

The larger size cell equipment, of course, gives longer life, but weighs more than the $2\frac{1}{4} \times \frac{3}{4}$ inch.

Each cell is in the form of a screw-top unit and each unit is as easily renewable as an incandescent lamp in a socket.

To put in an entirely new set of cells, it is only necessary to order a set of screw-top cartridge cells by express, for anyone can put them in place.

The cells used in these test sets are of special high grade glycerine type; they will last from 6 to 8 months without enough deterioration to interfere with practical everyday working of the set.

Western Electric PITTSFIELD

SPARK PLUGS

No. 96
Ford 1/2 Inch Single Point

No. 81
1/4-18 Thread

No. 95
Overland and Buick 1/2 Inch Double Point

Standard Porcelain Nut Spark Plug

The Western Electric-Pittsfield Spark Plug is the result of years of experience in the design and manufacture of spark plugs. The best grade of materials obtainable, the most expert workmanship and the unique design of this plug unite to make it undoubtedly the best porcelain plug on the market.

The porcelain is made of an imported kaolin, of a quality superior to any other clay obtainable, and will not expand or contract under widely varying temperatures.

The electrodes are made of genuine meteor wire, an imported alloy which is, next to platinum, the highest grade electrode material.

A prominent feature of this plug is the absence of any check-nut. This has been eliminated by a special manufacturing process by which the steel shell of the plug and the porcelain are practically made into one compact unit, of exceptional ruggedness, and is absolutely gas tight.

They can be furnished in all standard threads, and with one or two sparking points.

Spark Plugs for the Ford, Reo, Buick and Overland Cars

These plugs are especially designed for use with the Ford, Reo, Overland and Buick cars and embody all of the qualities of the standard porcelain plug.

The No. 96 has an extra long shell for use on the Ford and Reo car, which enables the user to get a grip on the plug with a wrench in replacing or removing the plug.

Nos. 90, 91, 94 and 95 are for use with the Overland and Buick cars or other types of cars having cylinders requiring extra long shells.

The porcelain used is specially imported kaolin, fired at an extreme heat that insures absolute durability. The wire used for sparking points is made of meteor wire, the highest grade alloy known for the severe duty which sparking points are subjected to.

PITTSFIELD

Spark Plugs—Continued

Standard Mica Plugs

In spite of the popularity of porcelain spark plugs there still remains a marked demand among many manufacturers and users for mica spark plugs. For these we offer a plug which, for strength and durability, cannot be excelled. It is, under working conditions, indestructible.

The construction consists of a heavy pure mica tube covering the electrode over which mica washers are assembled under heavy compression. The mica used is specially selected, and is of the highest quality obtainable.

The wire used for sparking point is made of special alloy. Owners of racing cars or high speed engines will find this plug specially suited to their requirements, and they are equally well adapted for general use.

These plugs are made in either the single point or double point types. Magneto plugs have two points for the severe temperatures of heavy magneto sparking, and will be furnished if called for on the order.

Special Spark Plugs for Franklin Automobiles

The H. H. Franklin Company have been using for some time as their standard equipment for their automobiles a special Western Electric-Pittsfield Spark Plug which has long proven to be the plug best adapted for the requirements of the Franklin car.

The highest grade of pure imported mica is used. It is cut into thin washers which are assembled over a pure mica cylinder which surrounds the steel center pieces, and the washers are clamped together under heavy pressure. The cylinder thus formed is then turned and ground to accurate dimensions, and fitted into a tapered hole which is likewise ground to secure an accurate fit.

Any additional pressure in the cylinder only tends to make this fit tighter. The electrodes are of a specially high heat-resisting material, imported for this special duty.

The whole plug is accurately made and is recommended exclusively as the best plug adaptable for Franklin automobile models previous to 1915.

37	1/8-18 standard A. L. A. M. double point plug	\$1.50	\$1.30
39	1/2 in. standard pipe thread double point plug	1.50	1.30

Mica Motorcycle Plugs

The Western Electric-Pittsfield Mica Motorcycle Plugs are made with the same precision that characterizes the entire line and the same selected materials and high workmanship are put into these plugs that are found in our other types. They are designed to meet the unusual conditions found in high speed motorcycle engines, and long and severe tests have proved that for motorcycle use they are most satisfactory.

One of the principal features of this plug is the small head on the stem in the combustion chamber which renders it practically soot-proof and also proof against short circuit, due to the increased distance between the head and the sides of the shell.

The spark points are made of a specially high heat-resisting alloy which will easily outlive the life of any motorcycle. They are furnished with either a screw or clip terminal as desired.

42	1/8-18 standard A. L. A. M. double point plug	\$1.00	\$0.90

PITTSFIELD

Timer With Top Cover Removed
—Showing Lever Arm and
Grooved Roller

Assembled Four Cylinder Timer

Grooved Roller—Showing Sharp
Contact-making Edges

Timers

Much of the so-called engine trouble is often due to inaccurate timing of the explosion. This is caused by using a timer that is poorly designed or constructed and which after short usage works out of adjustment.

The Western Electric-Pittsfield Timer is built to uphold an established reputation for excellence—it is strong, durable and reliable and embodies the best features of timer design. Back of it is the guarantee of the largest electrical manufacturers in the world.

Unlike most roller type timers the Western Electric-Pittsfield is not equipped with a flat surface roller, but with a grooved roller, which having sharp edges effectively cuts through grease and insures a positive contact.

The timer is equipped with double ball bearings—one at each end of the base, preventing wobbling on the shaft and insuring accuracy of the timing.

The central contact lever on which the roller moves operates on the shaft to which it is fastened by means of a key which is threaded with a fine thread and fastened at the top with a castellated nut and cotter pin. By turning this nut one groove, a play of .005 inches is taken up, enabling the lever to be kept tight at all times and preventing unnecessary wear.

The cover which is made of pressed aluminum is attached securely with spring nuts and will not shake loose. It fits the box tightly making it absolutely dirt and dust proof—yet can be easily removed for inspection. A terminal is provided on the cover for efficiently grounding the timer roller.

These timers are made in sizes from one to six cylinders, all standard types being bored for $\frac{1}{2}$ inch shaft. Timers for $\frac{3}{8}$ inch and $\frac{3}{4}$ inch shaft will be supplied, if ordered, for an additional charge of 65 cents list.

Western Electric

Master Vibrator and Spark Coils

MASTER VIBRATOR

Master Vibrator

Ford Ignition System. The standard Ford ignition system consists of an electric generator built in the fly wheel, a timer mounted on the engine and four transformer coils mounted on the dashboard. These coils are similar to the Pittsfield spark coil with a magnetic vibrator which makes and breaks the current supplied through the timer on the engine. The strength of the spark in each cylinder of the engine depends on the adjustment of the corresponding coil and in order to obtain perfect operation of the engine all four vibrators must be adjusted frequently.

It is to eliminate the necessity of adjusting four vibrators that the master vibrator is used. With only one vibrator to adjust, maximum efficiency in the ignition system is insured, and the wide use of master vibrators on Ford cars would indicate that Ford owners welcome a device of this kind.

The Western Electric Pittsfield master vibrator is adapted for operation on Ford Cars of the 1914 and earlier designs. The dash of the 1915 model Ford is smaller than the older models, due to the introduction of the cowl, which is new to Ford cars, leaving very little space for a vibrator of the Western Electric type. It, however, can be mounted on the dash of the 1915 car.

List Price Each

Western Electric Pittsfield Master Vibrator..... \$11.00

Six-Cylinder Spark Coil

Four-Cylinder Spark Coil

One-Cylinder Spark Coil

Dash Type Spark Coil

The Western Electric-Pittsfield Spark Coils are built for every requirement of automobile, motorboat and industrial gas engine ignition. All Dash Board Coils are constructed on the unit system.

The unit boxes are made of special composition, and are absolutely waterproof. They may be removed without changing connections, and fit accurately in place.

The Dash Spark Coil Cases are of mahogany, lock cornered, highly polished and thoroughly waterproof. Carefully made condensers built of the best material and perfectly proportioned with the working parts of the coil complete the system.

Western Electric-Pittsfield Switches are strong and absolutely free from danger of short-circuiting. The operation is absolutely positive. Switches are provided with a key for locking and may be furnished either for battery and battery, magneto and battery, or for magneto only.

Unit Construction. Western Electric-Pittsfield Spark Coils are constructed on the unit system, viz.: one unit coil for each cylinder of the engine. Each coil unit is self-contained and operated independently from the neighboring units. The loosening of the proper connections permits the removal of a unit for examination or replacement. With this arrangement an extra unit may be carried and used to replace a damaged unit. This operation does not necessitate stopping the engine.

Vibrators. Vibrators are of the latest improved type and are constructed to give the greatest frequency with a positive make and break at all times. The contact points are made of iridio-platinum and a condenser eliminates all sparking between the contact points, insuring the coil being operated over an extended period without any perceptible wearing of the contact points. The adjusting screw of each coil may be locked in position by means of a check nut, providing a permanent means of adjustment.

Single-Cylinder Marine Type Coil

Two-Cylinder Marine Type Coil

Marine Type Coils

Western Electric-Pittsfield Marine Coils are put up in the most thorough manner, and are perfectly insulated with a special compound, making them practically impervious to oil and water. The metal parts are formed with extreme care. The vibrator is an entirely new design and is the fastest and most economical vibrator made, and is equipped with extremely large iridio-platinum points.

In all the marine coils the units are assembled in very neat and durable solid oak boxes which can be laid down or screwed to the boat frame in an upright position.

These coils are made without switches, but can be furnished with any of the switches made by us if so ordered. Prices with switches furnished on request.

The one and two-cylinder marine coils are made with units molded in the box. The three-cylinder coil is of the same construction and design as the four-cylinder coil.

Kick-Off Lock Switch

Western Electric

PITTSFIELD

Ignition Switches

Baby Primary Switch

Kick-Off Lock Switch

The Western Electric-Pittsfield Kick-Off Lock Switch is simple and strong and is absolutely free from liability of short circuits, locks with a removable flat metal key and allows of the lever being shifted by the foot. This switch is readily installed by the ordinary layman as well as the skilled mechanic. It is absolutely positive at all times and is guaranteed to do the work for which it is intended.

List No.	Description	List Price Each
201	Kick-Off Lock Switch B and B.	\$2.26
211	Kick-Off Lock Switch M and B.	2.26
212	Kick-Off Lock Switch M only.	2.26
219	Kick-Off Lock Switch Key extra.	.15

Baby Primary Switch

The Baby Primary Switch was designed to meet the requirements of a small, simple, yet durable and efficient circuit breaker, and as such is heartily recommended.

This switch is made in both open and closed circuit type. The open circuit type is for use with open circuits such as high tension magnetos, the circuits being opened when the plug is in. The closed circuit type is for use with battery lines, the circuit being closed when the plug is in.

In ordering, state whether open or closed circuit switch is wanted.

202	Baby Primary Switch, open circuit.	\$0.76
203	Baby Primary Switch, closed circuit.	.76
208	Extra Key.	.15

HENRICK'S IGNITION MAGNETOS

LOW TENSION

Type S-6 and J-6

Heavy Duty Magneto

One-half inch phosphor bronze bearings. For make and break spark ignition. The cut shows the magneto with bevel faced governor which drives at thirty degree angle from the face of fly wheel. This machine can be furnished with flat governor to drive at right angles from the face or side of the fly wheel, or fully drive governor. For belt governor for $\frac{3}{8}$ inch round or $\frac{3}{4}$ inch flat belt add \$1.34 more.

Type		Size Inches	Speed	Wt. Lbs.	*List Price Each

AUTOMOBILE AND MARINE SIGNALS

Type L Klaxon

Type S Klaxon

Klaxon for 1915 Cadillac Cars

Combination Klaxon

The Klaxon possesses the true warning note: loud, abrupt, penetrating. It is operated by means of a push-button, on six to eight dry cells or a six to eight volt storage battery. Its note is instantaneous and entirely independent of the running of the car. Mechanically the Klaxon consists of an alloy-steel diaphragm set in violent vibration by means of a hardened tooth wheel. This is keyed on the shaft of a finely constructed little electric motor—a railway motor in miniature. The shaft is practically frictionless with a ball-bearing base. The instrument is dust and waterproof, needs no screen in front and may be cleaned with a hose.

AUTOMOBILE WARNING SIGNALS

Klaxonet Combination Type

Type L Klaxonet

Type S Klaxonet

**Sectional View of
Klaxonet Mechanism**

The Klaxonet

The Klaxonet is smaller in design than the Klaxon described on preceding page, but operated on the same principle. To gain compactness, the motor is placed on an incline behind the diaphragm and the teeth are cut slantwise on the face of the ratchet wheel rather than on the edge. The Klaxonet produces the true Klaxon warning note—higher in pitch, lower in volume; and every detail of its construction has been as carefully perfected. It can be satisfactorily operated on four or six dry cells.

HAND KLAXONET

[Hand] Klaxonet

Hand Klaxonet

The Hand Klaxonet represents the latest developments in the Klaxon line. It embodies in its construction and design the same high grade of materials that characterizes the latest Klaxon line.

Each Hand Klaxonet may be permanently guaranteed to give complete satisfaction indefinitely. It does not make any difference if the instrument has been abused, dropped on the floor, smashed in a wreck or anything else. It may be returned to the factory, express collect, and it will be put in perfect operating condition without charge.

Finishes. The Hand Klaxonet may be finished in black and nickel, black and brass, and all black.

Hand Klaxonets

For Motorcycles

Hand Klaxonets for motorcycles are equipped with a short projector and special attaching brackets, in all nickel, black and nickel, and all black.

Fire Alarm Klaxon

The Klaxon is heard—where the old-fashioned gong is not. This is the whole story in a word.

The Klaxon no sharp and penetrating. Its sound waves are like the teeth of a saw. They cut through other noise—all kinds of noise. This fact led originally to the adoption of the Klaxon in the fire alarm systems of noisy factories. No matter how loud the machinery the Klaxon is heard above it.

It is also adapted for use in schools, hotels, stores, clubs, dormitories and wherever else a sure alarm of fire may save lives and property.

The Klaxon is a noise machine—operated by electricity. Its sound is produced by a tough vanadium steel diaphragm set in violent vibration by means of a cam wheel. In the center of the diaphragm there is a glass-hard button with which the cam wheel comes in contact. The revolutions of the latter produce 33,000 vibrations of the diaphragm per minute. The cam wheel is keyed to the shaft of a finely constructed little electric motor. In the Klaxonet this motor is placed on an incline behind the diaphragm; in the Klaxon at a right angle to the diaphragm.

In both instruments the motor is a railway motor in miniature with laminated seven-coil armature and a commutator of standard type. Regularly they are wound for 6 volts.

No. 8062G

Benjamin Automobile Horns

Electric Horn for Ford Cars

The Ford Magneto furnishes current in excess of that needed for ignition purposes, and many unsuccessful attempts have been made by inventors to design a horn to operate from a portion of this excess current. The Fordorn blows directly from Ford Magneto current. No battery needed. No contacts to get out of order, nor commutator, bearing or oiling troubles as in motor horns. It is made in two styles: Model A, dash-board type, Model B, under-hood type. Standard finish on the former is black and brass; on the latter all black.

Regulite

The Regulite

The Regulite is a combination switch and electric controller which automatically chokes or impedes the magneto current to the lamps, prevents its rising to a voltage too high for their capacity, and keeps them from burning out. The construction and winding of the Regulite is such that it has practically no effect upon the magneto current at low speed. The lights are, therefore, allowed to burn.

8000A	Regulite complete..... \$3.36

AUTOMOBILE ACCESSORIES
The "Exide" Type S Ignition Battery
6 VOLT, 3 CELL

3S-7 Exide Batteries

The "Exide" Type S Ignition Battery, brought out in 1903, is the original "Exide" Ignition Battery, and has been used as standard equipment on many thousands of motor cars. The "Exide" Types LX and SX batteries listed on preceding page are of improved design and construction, and size for size are somewhat lower in price than the Type S batteries. When Type S batteries wear out in service, it will, therefore, be found desirable to substitute a Type LX or SX battery wherever the dimensions of the battery compartment permit of such substitution.

Automobile and Ignition Supplies

"EXIDE" LIGHTING AND IGNITION BATTERY

Exposed View of "Exide" Type 3LX-9 Battery

"Exide" Type 3LX-9 Lighting and Ignition Battery

This battery has been adopted by the leading automobile manufacturers, and is a radical departure in many important particulars from previous practice in the design of batteries for lighting and ignition service.

Unit Cell Assembly. Each of the cells which make up the complete battery is a separate sealed unit. This is an exclusive feature of great practical value. Since each cell is adequately and independently sealed, it is unnecessary to cover the entire top of the battery with sealing compound. Packing compound is also unnecessary.

Terminals and Intercell Connectors. Terminals are of a new design and adapted to conveniently receive and permanently hold connecting wires. The terminals are of acid-resisting alloy, contain no corrodible parts, are as convenient to handle as binding posts, cannot jar or work loose in service, hold the wires firmly and with ample contact, support the wires so as to make breaking of same under vibration of rare occurrence and enclose and protect the bared ends of the wires from acid and consequent corrosion.

Western Electric **SMALL BATTERY CHARGING OUTFITS**

Small Battery Charging Outfit

Small Battery Charging Outfits

FOR CHARGING IGNITION AND LIGHTING BATTERIES

The Western Electric Small Battery Charging Outfit consists of a standard Western Electric motor generator set, on which is mounted a switchboard specially constructed for this class of work.

The motor generator is of unusually compact design, having only two bearings, which require only an occasional oiling to insure perfect operation of the set. The construction of the end brackets is such as to allow ready access to the brushes and commutator for inspection.

The switchboard is rigidly mounted on top of the motor generator.

The switchboard is equipped with either a 10 ampere or a 40 ampere ammeter for reading the battery charging current; a 15 volt, or a 30 volt voltmeter for reading the battery voltage; a rheostat for adjusting the battery charging current to its proper amount; a push button switch to be pressed when voltmeter reading is to be taken; a snap switch for closing and opening the battery circuit and a snap switch in line circuit for stopping and starting the set.

The field rheostat will reduce the voltage of any set low enough to charge one 6 volt cell, but the charging rate used must not exceed the ampere rating marked on the generator name plate.

MECHANICAL RECTIFIERS

FOR CHARGING IGNITION BATTERIES

Rectifiers

Rectifiers

Type "V R" Mechanical Rectifiers

For transforming 60 Cycles-105-120-Volt Alternating Current into 7.5 Direct Current

The universal application of electrical apparatus to automobiles has necessitated the equipment of practically every automobile with a storage battery. Inasmuch as these batteries have to be recharged frequently with direct current, there is a large demand, in localities where direct current is not available, for an economical, efficient and reliable rectifier for changing the alternating current of standard voltage into direct current of the voltage of the storage battery.

The type "VR" Rectifier was designed and manufactured after much experimenting and extensive study of this problem. The principal characteristics of this rectifier are its reliability, high efficiency and compact mechanical construction.

The rectifier is provided with two (2) sets of leads, one set having an EDISON plug which may be connected to any convenient lamp socket, and the other set provided with terminals, one of which is painted red and should be connected to the positive (or+) pole of the storage battery and the other should be connected to the negative (or-) pole. In order to charge any storage battery, all that is necessary is to make the above connection and turn the key in the lamp socket when the rectifier will start and operate without further attention. If the supply of voltage fails, the rectifier will simply stop operating and the battery will not discharge: when the supply of voltage returns, the rectifier resumes operation automatically.

The automobilists who experience the greatest trouble with their storage batteries are those who allow them to become discharged too far. This not only reduces the capacity of the battery but also considerably shortens the life, and a careful car owner watches the condition of his battery closely to see that this condition never exists.

The compact construction of the "VR" Rectifier allows it to be carried conveniently in the tool box of the automobile while touring, and it is so simple in operation that it can be operated by anyone.

Rectifiers, Storage Batteries and Lighting Plants 2-2

EDISON ALTERNATING CURRENT RECTIFIER

Fig. 1-AC Rectifier
Size B4; 10 Volts, 16 Amperes
With controller and ammeter in use charging batteries

DESCRIPTION

Long and persistent experiments at the Edison laboratories have resulted in this device—a most reliable and efficient means of charging a storage battery from alternating current.

While the Edison Alternating Current Rectifier is made in the smaller size (C1) for charging three storage battery cells, it is particularly pointed out that the higher capacity of the larger size (B4) fills another size not heretofore covered—that of charging several batteries at one time in public garages.

The motor car owner using three storage battery cells may charge them over-night without attention after connecting the Rectifier to any lamp socket (supplying 100 to 120 volts—60 cycles alternating current) and the binding posts to the battery.

The public garage employing the Rectifier of 16 amperes capacity may connect four ordinary 40 ampere hour batteries in multiple and charge over-night in the same manner. If lead cells requiring varying currents are to be charged, the controller panel is desirable.

Rectifiers for other uses can be supplied up to 380 watts direct current output in various combinations of voltage or current. Within this capacity the Edison Rectifier will be found a more convenient and economical device than any other means of rectifying alternating current. Having no revolving or wearing parts requiring lubrication it may replace the rotary converter in many instances. It has been exhaustively tested and adopted for charging storage batteries in telephone work, replacing the smaller size mercury arc rectifier. Innumerable other uses await its application in which the manufacturers offer their advice and assistance.

Advantages: No flexible springs liable to require adjustment and loss of tension. Large carbon and copper contacts avoid troubles of all-metal contacts. Controller connections for variations of current if desired. Non-sparking over wide range of Alternating Current frequency. Passed and tested by Underwriters' Laboratories as safe—electrically and with gasoline vapor.

MERCURY ARC RECTIFIERS

Fig. 1

Fig. 2

For Small Battery Charging Sets

This rectifier is a modification of the ignition battery set with the idea of making it portable. It may be carried around in the garage (not intended for carrying in automobiles), plugged in at any convenient receptacle, and charge batteries in gasoline automobiles. It is appreciated that most gasoline automobiles are now equipped with self starters and generators for charging batteries. However, a battery will give longer life and better results if given a soaking charge monthly, even though it is charged regularly on the machine. The soaking charge removes any sulphate that may be carried on the plates, cuts down the internal resistance of the battery, and thus gives better service and longer life. Many cars are still unequipped with generators for charging, and have gas headlights. If owners of these cars had a rectifier at home where they could charge them once a week, many of them would put on electric lights and a storage battery of about 80 ampere-hours capacity which could be charged generally during the night. An owner of such a car could better afford to equip it with electric lights than to buy a generator and attach it to his engine.

DESCRIPTION

The rectifier consists of a metal base, on which are mounted the main reactance and a series alternating current reactance; and just above these, a tube holder containing a new type of rectifier tube, which is clearly shown in Fig. 2. The whole outfit is covered with a sheet metal cover. The alternating current supply is connected by means of a flexible lead and a separable attaching plug. The direct current is connected to two binding posts, distinctly marked (+) and (-).

The rectifier is designed for charging a maximum of 6 cells of battery from 110 volts alternating current. It is particularly designed for charging, starting, lighting and ignition batteries used in gasoline automobiles. The ignition and lighting batteries are generally of 3 cells, and starting batteries are generally of 3 or 6 cells. This means that one 3 cell, two 3 cell, or one 6 cell may be charged at a time. The rectifier has a characteristic of very nearly constant current. It may, in fact, be connected to a single cell of battery, and will charge it at a rate of approximately 6 amperes from a 110 volt supply. This rectifier can be furnished for 60, 50, 40, 30 or 25 cycle, 110 volt circuits. It can be used on voltages up to 130 volts and the current characteristics will be the same, only the current will increase as the alternating current voltage increases for a given number of cells.

The approximate dimensions of the rectifier are:

Frequency	Length	DIMENSIONS IN INCHES		Width
		Height		
60	9 1/2	10 1/4		6 1/4
40	9 1/2	10 1/4		6 1/4
30	9 1/2	11 1/4		6 1/4
25	9 1/2	11 1/4		6 1/4

EFFICIENCY AND COST OF CHARGING

The following table gives the watts input, direct current amperes and watt efficiency of the rectifier under various conditions. It should be particularly noted that on short circuit the rectifier delivers only 6.5 amperes, so that there is very little chance of a customer having trouble due to excessive current.

Number of Cells	A.C. Volts	A.C. Watts	D.C. Amperes	Per Cent. Efficiency
0	110	130	6.5	2.5
1		128	6.0	13.6
2		130	5.6	22.4
3		132	5.1	29.0
4		132	4.75	34.7
5		128	4.43	41.5
6		128	4.05	45.0

It will be noted from this table that the watts input under all conditions is about 130. At 10 cents a kilowatt hour this means 1 1/2 cents per hour; or for an all night charge of 10 hours, 13 cents. If two 6 volt batteries are charged the cost would be 6 1/2 cents per battery. Ordinarily, the charge at a public garage for charging such a battery is about 50 cents for a 6 volt, 3 cell, or 75 cents for a 12 volt, 6 cell battery. In some cases it is higher.

OPERATION

Figure 3 shows the rectifier connected to a 6 volt, 3 cell battery, with the alternating current line connected, and indicates also the method of starting. After the connections are made the rectifier is tipped slightly, as shown by means of the handle at the top. The rectifier should then require no further attention.

Where two 3 cell batteries are charged, they are connected in series; or if two small batteries, such as ignition batteries, and a charging rate of only 2 or 3 amperes is required, they should be connected in multiple.

ELECTRIC VULCANIZERS

No. 138187

Westinghouse Tire Vulcanizer

This type is especially adapted for vulcanizing cuts and tears in the inner tube and also sand pockets, blisters and tears in the outer casing, the average process requiring from 15 to 30 minutes. Repairs can be made in the shoe casing without removing the tire from the wheel. The complete outfit consists of the vulcanizer, fifteen feet of flexible cord, an attachment plug, a fifteen step rheostat attached to the clamping board, a clamp, two canvas attachment straps and a thermometer.

Type D—Repairing Casings

Type D—Repairing Inner Tubes

Type D—Table for Vulcanizing two Tubes

Shaler Electric Vulcanizer

MOTORISTS' MODEL TYPE D—PORTABLE

Current Consumption 70 Watts

This vulcanizer derives its heat from the most economical and convenient source, by attaching to any lamp socket. The exact vulcanizing temperature is maintained by a thermostat which automatically makes and breaks the circuit. The heating unit, which completely fills the interior of the vulcanizer, conducts the heat equally to all parts of a repair, insuring a uniform cure. The flat face of the heater, used in combination with an asbestos inlaid metal shelf, shortens the vulcanizing time by preventing radiation of heat. A concave, kidney-shaped face (see regular and rim plate), as illustrated on following page, fits on side of tread of any size casing while inflated on wheel. The self-adjustable universal clamp insures uniform pressure all over a repair and makes application to the tire easy and quick. Vulcanizing surface, $7\frac{1}{4} \times 3\frac{1}{2}$ inches, on which two tubes can be vulcanized as quickly as one, furnished with 10 feet of conducting cord, U. S. Government tested heat gauge. Para rubber, cement and full set of directions. Type D83 works on both direct and alternating current.

Automobile and Ignition Supplies

SHALER VULCANIZERS

Type F No. 31

Safety Vul-Kit No. 32

Safety Vul-Kit No. 32

Tube-Kit for Tubes

The Tube-Kit, which is intended to be carried in the tool box of a car for emergency repairs, mends all tube injuries quickly and permanently.

The correct amount of heat is produced by a lamp which burns gasoline or alcohol without smoke, soot or dangerous exposed flame. The fuel is contained in the lamp in such a way that accidental tipping over of the vulcanizer while in use would not cause trouble. A measure, graduated to give the proper fuel charge to cure every repair exactly right, is furnished with the vulcanizer so that no watching or regulating is necessary. The largest tube can be mended without pinching the edges. Vulcanizing surface 10 square inches. The handle is detachable and the outfit is packed in a small strong box for carrying with car.

List Each

31 Type F Shaler Tube-Kit, weight 4 lbs., with repair material, nickel plated. \$2.50

Safety Vul-Kit Complete for Casings and Tubes

Besides making every practical kind of tube repairs, the Safety Vul-Kit has a $3\frac{1}{2} \times 4$ inch surface curved to fit any sized tire for mending casing injuries. As this vulcanizer produces no exposed blaze it can be used close under a fender without scorching the paint. The lamp, which burns either gasoline or alcohol, contains the fuel in such a way that it is impossible to spill blazing liquid even if the vulcanizer were accidentally upset. The fuel supply is limited to that required for perfect vulcanization. You can't overcure or undercure a repair. Tube repairs are cured on an asbestos inlaid plate, $3\frac{1}{2}$ inches in diameter, which is swiveled so that uniform pressure is automatically applied to all parts of the repair. The Vul-Kit is nicked and polished, packed with repair material in strong box for carrying in tool box of car. Weight 5 lbs.

32 Type G Safety Vul-Kit. \$4.50

Type S or J
Repairing Inner Tube

Repairing Casing while
on Wheel

Ford-Kit

Ford-Kit

Steam Heated Model

Unlike cheap vulcanizers designed for superficial repairs it maintains the vulcanizing temperature automatically as long as desired so that a deep casing repair requiring a long cure can be made as perfectly as a thin tube repair requiring only a few minutes. This is done automatically by a thermostatic damper which regulates the intensity of the alcohol flame. This damper and the safety valve, which is an additional precaution against overheating, make the Shaler the only reliable portable steam vulcanizer. Vulcanizer heats while you prepare a repair and needs no watching or regulating while on the tire. The patented handle saves time when making several repairs in succession by allowing the hot vulcanizer to be moved from one repair to another. Flat side of heater mends all sized tube injuries on a metal shelf inlaid with asbestos to retain the heat and prevent pinching the tube. The opposite side is concave to fit on any sized casing while on rim. Vulcanizing surface 3×5 inches. Larger repairs made by resetting vulcanizer.

22 Type S Steam Vulcanizer, polished nickel, weight 13 lbs. \$18.76
11 Type J Stitch-In-Time, nicked, weight 11 lbs. Same as type S except heated by alcohol,
no steam used. 15.00

The Ford-Kit

For Mending Ford Casings and Tubes

Especially designed to fit 3 inch and $3\frac{1}{2}$ inch Ford tubes and casings. Tubes are mended exactly the same as with the Tube-Kit shown above. Complete with repair material.

33 Type H Ford-Kit, nickel plated, weight 5 lbs. \$3.50

Cycle-Kit

For repairing all sizes of motorcycle tubes and casings. Identical with Ford-Kit.

35 Type K. \$3.50

Delivery F. O. B. Factory, Waupun, Wis. For warehouse deliveries write nearest house.

GARAGE STEAM HEATED VULCANIZERS AND SUPPLIES

Steam Heated Plant

Covers every requirement of garage or repair shop, handling every practicable sort of tube and casing repairs. Tube plate $4\frac{1}{2} \times 30$ inches vulcanizes six tubes at once.

Casing repair forms use the wrapped tread method described on previous page.

Temperature controlled automatically. No attention required after lighting the burner. The boiler, a copper coil, raises steam in about twenty minutes and holds it there indefinitely, a thermostatic damper automatically regulating the flame.

Specify whether gas or gasoline burner is desired. Gasoline burning equipment regularly furnished.

No. 41 Type NPR. Complete garage outfit as shown..... List Price \$90.00

Includes 6 clamps and blocks for tube work, bead strips for rim cuts, casing clamps, tape for wrapping treads, thermometer, steam gauge and safety valve. Weight 180 lbs.

Automobile and Ignition Supplies

PACKARD ARMORED CABLE
FOR IGNITION, STARTING, LIGHTING

Armored Cable, Double Protection

Packard Armored Cable

For Use on Automobiles, Motor Trucks and Motor Boats

The core of the armored cable consists of strands of soft-drawn tinned copper wire laid in reverse layers, making the core flexible and round in cross-section. As many strands are employed as is practicable without introducing the danger of individual strands breaking when cable is sharply bent.

By this construction the highest possible factor of conductivity consistent with mechanical strength is obtained.

In the schedule of specifications, size refers to the gauge of the core and ranges in single conductor cables from No. 18 to 00; in twin conductor from No. 18 to No. 8.

Insulating Covers. These are made in three combinations, determined by limitations of diameter and the service required of the cable. Enough material is put on to guarantee perfect insulation with a generous factor of safety.

The term style is used to indicate what materials are placed between the core and the braid.

The Braid. Over the insulating material there is placed a layer of braid, the thread of which is made exclusively for the manufacturer under their own specifications. It is tough and hard and strong. When tightly woven it furnishes a partial armor against abrasion and also serves as a net to carry the enamel.

The Enamel. An elastic enamel having the peculiar property of being oilproof is applied and being of very light consistency it fills and closes every pore of the braid, successive coats being added until the insulating material is sealed in the enamel, thus becoming a sheath of flexible "skin" which effectually keeps oil out. This is one part of the double protection.

The Armor. Protection against mechanical injury, abrasion, vibration and other factors that conspire to kill cable is added after the braid has been oilproofed. This is an all metal covering, a ribbon wound on in a very close-fitting coil, which armors the cable and at the same time leaves it flexible.

Brass, plain or nicked, is used; also a special rustproof steel.

Width and thickness of ribbon vary with cable size and service required.

In our specifications the numerals, 1, 2 and 3 are employed to designate which metal the armor is made of.

This is the other part of the double protection.

Packard Armored Cable Specifications

Sizes	Style	Armor
Single conductor, all sizes from No. 18 to 00, inclusive.	A—Cotton wrapping, braid—Packard enamel.	No. 1—Nickel brass.
	C—Cotton wrap, cloth, braid—Packard enamel.	No. 2—Plain brass.
Twin conductor, all sizes from No. 18 to No. 8, inclusive.	E—Rubber, braid—Packard enamel.	No. 3—Rustproof steel.

Core Size, No. of Conductors, Style and No. completely describes any cable.

Any size core may have Style A, C or E insulation and any one of the styles of the three kinds of armor.

PACKARD AUTOMOBILE CABLES

For High and Low Tension Ignition

Packard Cable is constructed so as to withstand the continuous presence of heat, grease and oils. These are the arch-enemies of rubber in all forms. These cables are hermetically sealed from every deteriorating influence.

Combination High Tension Cable

This cable is suitable for all forms of severe high tension service. Color is Packard brown with double red striping.

Combination High Tension Magneto Cable

This cable is designed for magnetos with small terminal. Color is Packard brown with double red striping.

Plain High Tension Cable

This cable has four (4) layers highest grade rubber. Made for those who desire a plain, unprotected cable. Color, natural rubber gray.

Combination Low Tension Cable, 1-Strand

This cable is standard for all kinds of low tension service. Color is Packard brown with double red striping.

Combination Low Tension Cable 2-Strand

This cable is round in form and is particularly adapted to single and two cylinder engines. Replaces two single cables. Colors of conductors are red and black; completed cable is Packard brown with double red striping.

Combination Low Tension Cable, 3-Strand

This is an excellent cable for two cylinder engines; also for wiring a double set of batteries. Made with filler so as to be round in form. Colors of conductors are red, black, green; completed cable is Packard brown with double red striping.

Combination Low Tension Cable, 4-Strand

The 4-strand cable is adapted to wiring four (4) cylinder engines from coil to timer. Made with filler so as to be round in form. Colors of conductors are red, black, green, brown; completed cable is Packard brown with double red striping.

Combination Low Tension Cable, 5-Strand

The 5-strand cable is very convenient for wiring a four (4) cylinder engine when a ground or neutral wire is desired. Round in form. Colors of conductors are red, black, green, brown, red-black; completed cable is Packard brown with double red striping.

Combination Low Tension Cable, 6-Strand

The 6-strand cable is for a 6 cylinder engine. Used from coil to timer. One cable is easier to install, is much neater and the individual conductors are doubly protected. Round in form. Colors of conductors are red, black, green, brown, red-black, red-green; completed cable is Packard brown with double red striping.

PACKARD AUTOMOBILE CABLE

For Electric Lighting and Starting Systems

While good ignition cable is important and necessary to the successful working of any car, yet the wiring of electric lighting and starting systems is even more important. The reasons are as follows: 1st. The cables are concealed and in inaccessible places. 2d. They are subjected to more abrasion and vibration. 3d. They are exposed to more dust, water and mud. 4th. Possible damage to storage batteries. 5th. Danger by fire due to short-circuits.

Packard Lighting Cables are made after the general style and of the same construction that characterizes Packard Ignition Cables. Each single conductor is protected by a double braid and the usual Packard finish. These single conductors are then stranded and made round in cross-sections by filling material. The assembly is then covered by a double braid of characteristic brown with double red striping and finished in the usual manner. These cables are as small in diameter as is consistent with absolute reliability.

The Combination Lighting Cable No. 8, both 1 and 2-strand, is used almost exclusively for wiring electric starters. General construction, colors, etc., same as the other sizes except the 2-strand is oval instead of round in cross sections.

Combination Lighting Cable No. 14, 1-Strand

This cable is recommended for wiring tail-lamps. Color is Packard brown, with double red striping.

Combination Lighting Cable No. 14, 2-Strand

This is a round form cable and is recommended for wiring tail-lamps. Color of conductors is red and black. Completed cable is Packard brown with double red striping.

Combination Lighting Cable No. 12, 1-Strand

This cable is recommended for wiring side and head-lamps. Color is Packard brown with double red striping.

Combination Lighting Cable No. 12, 2-Strand

This cable is recommended for wiring side and head-lamps. Made with filler so as to be round form. It is a popular style and size. Color of conductors is red and black. Completed cable is Packard brown with double red striping.

Combination Lighting Cable No. 10, 1-Strand

This cable is recommended for wiring from generator to battery and from battery to switches. Also for wiring large head-lamps. Color is Packard brown with double red striping.

Combination Lighting Cable No. 10, 2-Strand

This is a round form cable and is recommended for wiring from generator to battery and from battery to switches. Also used to wire head-lamps which are of large size. Color of conductors is red and black. Completed cable is Packard brown with double red striping.

Champion Solderless Terminals FOR SPARK PLUGS

These screw terminals are for use on secondary high tension cables only. The illustration above shows the hollow screw terminal after it has been screwed into the cable with the rubber insulation cut open to see just how the wire strands enter the hole in the screw to make electrical contact. To fasten the screw terminals take the end in one hand and the terminals in the other, moisten the screw and press the point of the screw into the end of the cable so that the wires will enter the terminal. Then screw the terminal up to the shoulder. If brass ferrules or fiber sleeves are used the ferrules or fibers are first placed on the cable and the screw is threaded into the cable through the hole in the ferrule or fiber.

Description	Std. Pkg.	List Price

Note: All terminals complete with brass ferrules for 7 MM. cable. Will furnish 9 MM. brass ferrules at same price.

Special Box Assortment. 25 of each type terminals, 25 each of fiber sleeves for 9 MM. and 7 MM. cable, 25 each brass ferrules for 9 MM. and 7 MM.; 25 primary terminals packed securely in box.

Contents, special box assortment..... \$10.00

J-D Terminals

These spring terminals are a marked improvement over any similar terminal on the market. They are made in one piece, therefore much stronger and more compact; have a superior spring action as the spring brass has a torsional bend at the vertical part, which results in more resiliency.

This construction gives a greater range of movement, also insures greater permanency. Made in slip and ring types in all of the above sizes. Wing type terminal can be used universally. Price, each 5 cents; per dozen \$0.50

J-D TERMINAL ASSORTMENT

These assortments are carefully selected and packed in a reinforced box with each division labeled with a terminal number. A necessity in every garage as it will always give the purchaser a stock of terminals for which there is a demand. The size of slip terminals is figured in thousands.

No. 1 Box J-D ASSORTED TERMINALS

"AMERICAN BEAUTY" AUTOMOBILE ACCESSORIES

Cigar and Pipe Lighter

Automobile Cigar and Pipe Lighter

This new device is made for battery circuit only and can be attached to any 6 volt storage battery such as is used on the majority of gasoline automobiles, motor boats, etc. The heating element is arranged in a small spiral coil, which grows red hot in a few seconds after the current is turned on and is practically indestructible. The casing is finished in polished nickel and the handle is of wood with ebony finish. Furnished complete with green silk cord, either single or double point Edison standard automobile plug for use on grounded or two-wire systems and a nickel-plated protector sleeve or holder. This sleeve protects the lighter from being accidentally turned on when not in use and can be fastened to the body of the car, thus making a convenient receptacle for the device.

The lighter is very neat in appearance, takes up little room, will not "drain" the battery and will add greatly to the equipment of the finest and most luxurious of cars.

List No.		List Price
330927	Automobile Cigar and Pipe Lighter	\$2.40

No. 3915

No. 3920

**Electric Heaters
FOR ELECTRIC COUPÉS**

No. 3915 type heater is generally installed in the electric coupé below the seat near the floor; thus it is out of the way and in a place where heat is most effective. These heaters are connected to the battery of the electric car and can be turned on and off at will. The body of these heaters is made of perforated steel and finished in black japan. Frame and end pieces finished in polished nickel.

List No.		List Price
330915	Electric Heater	\$8.00

No. 3920 type heater can be placed on the floor of the car as a foot warmer and car heater or can be permanently installed on the floor with a cord connection to the storage battery.

These heaters can be furnished in any voltage above 32. The usual voltages are 40, 48, 64 and 80. Voltage should be specified when ordering.

AUTO LAMPS AND DISPLAY CABINET

Dealers' Cabinet

Dealers' Display Cabinet

This display cabinet contains 100 of the well-known national Mazda automobile lamps. This stock enables you to make renewals on practically all types of American made cars. The stock is carefully selected from the wide range of national Mazda lamps. It includes ten of the widely talked of Mazda C gas filled headlight lamps. This cabinet itself is a convenient counter display and container for the lamp stock. Each cabinet is supplied with sales literature and the National Guide to the proper lamps for 1913, 1914 and 1915 automobiles.

Incandescent Lamps

AUTOMOBILE ELECTRIC LIGHTING SUPPLIES

GENERAL

The universal success of the hold-fast connectors for all automobile wiring is due to their scientific design and construction. This line of connectors is the result of years of experience in the automobile field. The higher grade of seamless brass tubing and hard rubber is used in the manufacture and expert workmanship insures a practically indestructible product.

Connector Plugs

The line of connector plugs is most complete; all are interchangeable and can be used with all sockets and receptacles of standard manufacture. Most of these plugs are illustrated in connection with the sockets shown below.

List No.		*List Price Each
32	Plain rubber. Furnished standard with all connectors unless otherwise specified.	\$0.24
32C	A 32 plug threaded and furnished with a molded composition cap which conceals the terminals.	.36
321C	A 32 plug for changing one wire to a two wire system. For use with a trouble lamp on a two wire system.	.50
55	Capped plug, hard rubber, screw cap. Single or double contact.	.50
77	Separable plug. For use with flexible metal tubing, but can be used with unarmored fittings. No threads on the rubber part to strip or loosen.	.70
Elbow plug, long cap.	For side lamp connections.	1.20
Elbow plug, short cap.	For side lamp connections.	.90

Connectors

All connectors are furnished with positive contacts, always under pressure, the tension being furnished by heavy coiled music wire springs which are rustproof. Heavy brass inserts are used, insuring perfect contact points and a maximum conductivity.

List No.		*List Price Each
41	$\frac{5}{8}$ in. diam, drawn flange, for use on wooden dashboard. Receptacle only.	\$0.50

105	Receptacle only (as illustrated)	.70
105	Receptacle (as illustrated)	.70

No. 15-S type, wires enter from the side, used in short coupled lamp where space is limited.

No. 104 type, to be used in both sides and tail oil lamps permitting the choice of either kind of illumination.

No. 115 type. For use in tail lamps; removable interior permitting the soldering of the shell into the lamp.

No. 17 type. For use in both side and tail oil lamp. No solder necessary, held in place by means of nuts.

No. 31CR type. For use on the end of a trouble lamp.

No. 16 type. Same use as type 104, except socket has threaded outer sleeve. Sleeve soldered in the body of lamp, permitting the removal or replacement of the socket at will.

No. 105 type. Designed to take the bulb on trouble lamp extension cord; to be used in connection with a one-wire system.

Searchlight

The C-S Searchlight is designed to meet a demand for a powerful searchlight of small size and weight. This lamp is 3 inches in diameter, is constructed throughout of brass, is highly polished, has a high-grade lens and is furnished with an 8 C.P. Helical Coil Tungsten bulb. It is also furnished with a focusing device so that with the aid of a Helical coil bulb, a very strong spot light is secured; one that will allow the reading of number signs at 200 feet. The lamp is also furnished with a self-contained switch which enables the operator to turn it off at will, and eliminates all necessity of installing an additional switch on the instrument board.

The lamp is fastened to a very substantial bracket which is so designed that it can be clamped to the edge of any wind shield (see illustration). This bracket is provided with a double swivel joint so that the light may be thrown in any direction and at any angle.

C-S Searchlight

List No.	*List Price Each
C-S Searchlight complete with bulb, bracket, extension cord and attachment plug	\$3.50

Western Electric

CHAU-PHONE

Western Electric Chau-Phone

A Telephone for Limousines

The Western Electric Chau-Phone is a telephone equipment designed for automobiles of the Limousine and Landaulet types. It meets the demand for an efficient means of communication between the occupants of a closed car and the chauffeur and is intended to replace the unsatisfactory and old-fashioned speaking tube.

The Chau-Phone consists of a hand transmitter for the car occupants which is connected to a megaphone-shaped receiver placed at the chauffeur's ear. The design of this talking combination is such that orders spoken in an ordinary conversational tone are delivered—with the tone volume magnified—loud and clear, above all wind and street noises, no matter how fast the car may be going.

This eliminates the trouble encountered in the use of the speaking tube in transmitting orders from passenger to chauffeur. With a speaking tube it is necessary for the latter to drive to the curb and stop the car or else the passenger must open the door and shout, with the attendant risk of injury from passing cars.

The Chau-Phone can be installed as readily on old as on new cars, and the wires may be concealed. The regular car batteries—6 to 8 volts—will operate it. The current required is so small as to be negligible. The transmitter is light, compact and durable, and no current is consumed while it is not in use. The receiver may be used for either right or left hand drive. The megaphone shape of the horn increases the sound volume, and insures clear enunciation. The entire instrument is weatherproof, and there are no moving parts to get out of order. The standard finish is black.

The high standard of design and workmanship displayed in every one of the 8,000,000 Bell telephones is maintained throughout in the Western Electric Chau-Phone. Each Chau-Phone is put up in a substantial package containing wire and everything else necessary to install it, including complete illustrated directions. The use of the Chau-Phone by a large number of leading car and body builders is conclusive proof of its excellent qualities. It completes the luxury and comfort of the closed car.

VICTOR AUTOMOBILE LAMPS

The Victor Automobile Lamps have been designed and constructed with the idea of producing a light-unit, the prime characteristics of which would be serviceability and beauty of design. Nothing but high grade materials are employed in the construction of these lamps, and all parts are fitted together so as to be taken apart and put together by the most inexperienced hand.

Among the salient features of this line of lamps are: The stamped steel body with 3 coats enamel baked on; parabolic reflector, heavily silver plated; stamped brass door, nickel plated; hard rubber connectors, properly insulated; props riveted, not soldered; clear crystal glass; bulbs any voltage or C.P.; double or single contacts with focusing device.

LOOK-OUT AUTOMOBILE REAR SAFETY SIGNAL

Trade Mark Reg. U. S. Patent Office
 Patents Pending

Rear Safety Signal

The present method of signalling when it is necessary to slow down or stop is for the driver to put out his arm and wave his hand. To thus signal he must take his hand off the wheel. On rainy days, with rain curtains down, he cannot do this; neither can he from a closed car. If he drives on the right hand side of the car, and the man in the rear drives on the left, his signal cannot be noticed. The greatest objection to holding out the hand is the fact that one hand ought to be at the wheel and the other hand at the lever; thus the driver holds out his hand either too soon or too late, and his signal is of no avail.

Special attention is called to the push button with a lamp combined attached to the driving wheel of the automobile. It is exactly where the driver has his thumb.

At the rear of the automobile is the Look-out Signal. This may be attached anywhere in the rear of the car, on the mud guard, in the center of the body or wherever convenient.

If the driver wishes to turn, slow down or stop, he presses the push button with his thumb, and as long as he has his thumb at the push button the "Look-out" hand is waving up and down just as he is doing when he holds out his hand to tell the driver in the rear to "Look out." The little lamp next to the push button flashes every time the look-out hand waves; thus telling the driver that his rear signal is working properly. At night, in addition to the waving hand, a purple light intermittently flashes its warning rays at the driver in the rear.

The Baer "Look-out" rear safety signal is the only day and night signal. It is the one signal that does exactly what the driver is expected to do; waves its hand at the driver in the rear, warning him to "Look out."

AUTOMOBILE AND MOTORCYCLE ACCESSORIES

Bicycle and Motor Lighting Outfit

Victor Bicycle and Motorcycle Lighting Outfit

Outfit consists of battery box made of steel with removable lid, finished in black japan, baked on. Box is insulated at end to prevent short circuiting, clips are riveted to box and three heavy leather straps are used to attach box to bicycle under seat, as illustrated. From battery box extends 24 inches of weatherproof cable, running to nickel-plated electric head lamp 4 1/4 inches in diameter, which is fitted with switch turn light on or off at will. This head lamp has glass front to protect electric bulb and keep parabolic automobile type reflector from losing high polished finish. An adjustable bracket is furnished to fit lamp to any machine. Will burn continually 40 to 44 hours. Intermittently 3 to 4 months. Operates on two ordinary dry cells. Costs one third of a cent an hour to burn one hour.

*List Price Each \$2.00 *List Price per Dozen \$21.00

Shock Absorber

Temco Shock Absorber

A shock absorber for Ford cars. A real mechanical device of perfect balance, stable, high-grade construction. Two spiral springs—one working within the other—are used in each cylinder. These springs are made of crucible vanadium steel, and represent 50 to 75 per cent. greater cost and efficiency than those found in other shock absorbers.

AUTOMOBILE SUPPLIES
Master Garage Pump
MODEL "P"

The equipment consists of a two-cylinder pump mounted on a frame and driven by a $\frac{1}{2}$ H.P. motor. With each outfit is furnished 20 feet of best reinforced rubber air hose, with pressure gauge attached and 20 feet of lamp cord with plug.

A small nozzle is furnished to fit on the end of the hose, so that the outfit may be used as a compressed air cleaner. It is very handy as such for blowing the dust out of various obscure parts of the upholstery and the little nooks and corners in a car which are hard to reach with a brush or otherwise.

Kellogg Single Cylinder Engine Driven Tire Pump
MODEL 101

Made of metal throughout. Finest gray iron cylinders, piston fitted with four metal rings, shaft drop forged and bearings of finest phosphor bronze. The oiling system is very simple. Pour oil through one cup only. Furnished complete with rubber tubing, gauge and attachments carefully fitted and easily installed on practically all 1914 and 1915 cars and many other models. A, metal piston ring; B, piston guide; C, two bronze connecting rods; D, one oil cup which supplies lubrication for piston and cylinder walls; F, Baffel plate, which prevents oil from splashing into piston and cylinder walls; G, oil level drain.

Kellogg Engine Driven Tire Pump
FOR THE FORD MODEL T

The new Kellogg Pump is built expressly for the Ford car. The cylinder is of the finest close grained, gray cylinder iron, and piston is fitted with ground steel rings. The crank shaft is a drop forging. The connecting rod and all bearings are phosphor bronze. Attachments are carefully fitted and easily installed in 20 minutes. No holes to bore, simply tighten up two bolts. Gears are strong and chamfered, so pump can be started while motor is running. Rubber tubing long enough to reach all four wheels, and a gauge to indicate pressure in the tire while it is being inflated are furnished with each outfit.

Motor Car Mat

Gasoline Storage Outfit

Acme Motor Car Mat

The Acme Flexible Steel Motor Car Mat is made of galvanized flat cold-rolled steel, and is practically indestructible. It fits any Ford car, hugs the floor, is sanitary, self-cleaning, and is more economical than the cheap rubber mat generally used. It is weatherproof, wearproof, cooler in summer and cleaner in winter. It will outwear a dozen rubber mats.

List No.		*List Price per Dozen
330919	Acme Flexible Steel Motor Car Mat	\$42.00

"Perfection" Gasoline Storage Outfits

The tanks furnished with these outfits are of welded steel construction, are galvanized both inside and outside, and further protected by a coating of rustproof paint. These welded tanks have almost twice the strength of the old steel riveted tanks of the same thickness of material. The absence of rivet holes removes the principal cause of leaks. They cannot leak, as they are subjected to both hydraulic and air pressure tests. These welded tanks are fitted inside with a galvanized dip pipe, to which the suction line is attached. There is supplied for the suction line two pieces of $\frac{3}{4}$ inch galvanized iron pipe, each 36 inches long, and two $\frac{1}{4}$ inch elbows. This enables the placing of the storage tank 3 feet under ground and outside of the building. The fill pipe is a 2 inch galvanized pipe, 36 inches in length with a ventilating brass cap.

The suction pump is built especially for gasoline; it is made entirely of brass except the iron handle. The cylinders are seamless brass, 2 inches in diameter. The brass padlock and chain furnish an important feature, preventing children and unauthorized persons from tampering with the gasoline.

Batteries and Accessories

COLUMBIA "HOT SHOT" IGNITION BATTERY

"Hot Shot" Battery

Columbia "Hot Shot" Battery

The Columbia "Hot Shot" is a unit battery containing from three to ten specially made cells connected in combinations to meet all requirements from $4\frac{1}{2}$ volts to 9 volts.

The battery is designed especially for automobile ignition, for electric horns, for motor boat and gas engine ignition, for operating carriage electric lamps, for mine signals, for household service, and for electric toys—in fact, for every place where a reliable dry battery is needed.

The containing case is weatherproofed fiber paper. The top is sealed with hard sealing-wax. Brass binding posts and cord handles are provided which makes the outfit easy to carry. The type number designates the number of cells and method of connecting them.

The first figure designates the number of sets of cells and if more than one, these sets are connected in multiple; the second number, the number of cells in series; the third number, the size of the cells, and the last number shows whether cells are arranged in one or two rows. Number 2462 means two sets of cells in multiple, four cells in series in each set, and number 6 cells, two rows.

COLUMBIA MULTIPLE BATTERIES

Multiple Battery

Multiple Batteries

The Columbia Multiple Battery is a unit proposition. Only two connections have to be made. Inside the hermetically sealed box the cells are separated by wooden pieces and then are held in place and entirely covered by a solid, waterproof insulating compound, which absolutely prevents any motion of the separate cells. The connections are not temporarily made to the binding posts by light wires, but are permanently soldered copper strip, so that the resistance between each pair of cells is practically nothing.

This battery represents the latest developments in primary battery manufacture and combines maximum efficiency and reliability with simplicity. Its uses can be classified under three heads: (a) Motor Ignition, (b) Lighting, (c) Miscellaneous.

(a) **Motor Ignition.** On automobiles, trucks, motor boats, launches, gas, gasoline, etc.

(b) **Lighting.** On automobiles, such lights as tail, side, limousine, etc., and for exploration or trouble lamps on extension cord. On power boats, for running lights and the lights used in lockers or cabins, etc.

(c) **Miscellaneous.** Under this division may be listed a number of uses. Among them are mine signals, blasting equipments, transmitter circuits of telephone train dispatching systems, vibrating and massage machines, electric horns and sirens.

How to Select It. If you know the voltage for which your apparatus was built, you can figure the proper battery by the following rule: To obtain the approximate voltage of a multiple battery, multiply the second digit in its number by $1\frac{1}{4}$. Example: 356 Multiple Battery. $5 \times 1\frac{1}{4} = 6\frac{1}{4}$ volts. It is therefore evident that a 356 should be used on 6 volt equipment.

In General. Where 3 dry cells are used in series, get Type 536 Columbia Multiple Battery. Where 4 dry cells are used in series, get Type 346 Columbia Multiple Battery. Where 5 dry cells are used in series, get Type 356 Columbia Multiple Battery. Where 6 dry cells are used in series, get Type 266 Columbia Multiple Battery.

How to Connect. Place the battery in the position it is to occupy in service. Scrape the ends of the wires clean and bright, connect to the binding posts and screw the cap down tight.

 Batteries and Accessories

PATTERSON BATTERY SETS

(Patented U. S. and Foreign Countries)

General Description

The fundamental principle of a Patterson Battery Set is a Screw Top Battery Cell which, without wires or binding posts, screws into a solid hard rubber plate, automatically making all connections. Loose connections, bad contacts, or loss of power from bad contacts, are impossible. The renewal of a cell is as easy as the renewal of an incandescent lamp. Simply screw the cell into the receptacle.

A Patterson Battery Holder will not only maintain a set of batteries at much higher amperage than the old method of installation, but will in a few years save its entire cost by greatly increased life of the cells. Individual cells in Holder may be tested with an ammeter without removing the same from the outfit, or a test of the complete bank of cells may be made at the terminals.

The Battery Holder will last a lifetime, as every part is made of the best material and designed to give the user an outfit which will be a constant source of satisfaction year in and year out. Screw-cups are renewable if necessity ever demands. Heavy contact springs of genuine phosphor-bronze make absolute, positive contact with the brass-capped carbon electrode of the cell; the contacts automatically clean themselves every time a battery is screwed in or out of the Holder and the heavy pressure of the phosphor-bronze center contact spring acts as a locking device on the cell, making it impossible for the same to become loose.

An Automatic Bridge in each cell receptacle (except Multiple Outfits) permits the removal of one or more cells from the set without opening the circuit; and also provides a quick test for a weak cell without an ammeter.

When the circuit wires are once connected to the battery they never have to be disconnected or re-connected. Any predetermined change of circuit connections may be made to take care of specific conditions; that is, any voltage or any ampere capacity may be arranged for, providing the number of units is sufficient to so do; if not, additional units may be put in and the outfit built up to any capacity voltage or amperage desired.

Screw Top Batteries

The opposite illustrations show types of standard dry cells such as are required for use in the Patterson Battery Holders. It will be noted that one type is strictly a cartridge-cell unit that can only be used in a battery holder, while the other is provided with binding posts so that the cell may be connected up the same as any dry cell, or by removing the binding posts may be used with perfect satisfaction in the battery holder, the top being threaded for this purpose.

These cells are universally available in the Blue Bell and Red Label Blue Bell; also in Columbia and all the principal brands of the National Carbon Company's make.

MODEL DESIGNATION

Patterson Battery Sets may be classified in three general types: series, multiple-series and four-circuit reserve.

The scheme of model designation is as follows:

- "B" indicates type of Holder
- "M" indicates Multiple circuit connections
- "S" indicates Series circuit connections
- "U" indicates Universal circuit connections, i. e., four-circuit reserve
- "W" indicates W. E. Co. circuit standards

- "C" indicates Cabinet mounting
- "B" indicates Box mounting
- "R" indicates Backboard mounting

The first numeral after letters in model-number indicates the number of rows of cells; the numeral following indicates the number of cells in a row.

For example, a model "BMC-36" is an outfit made up of "B" holders with "Multiple" connections in "Cabinet" form, 3 rows of 6 cells. If the same outfit was made up with 2 rows of 4 cells it would be designated as a "BMC-24." If the outfit were connected in "Series" instead of "Multiple" the letters used for the model designation would change from "BM" (Multiple) C to "BS" (Series) C. If the outfit was a 4-Circuit Reserve it would be a "Universal" (not Multiple or Series); therefore, the outfit would be designated as "BUC."

It is always necessary to designate by plain description whether the cabinets are to be flush steel, flush oak, surface steel or surface oak.

"Split-Circuit" Sets are designated exactly the same as above, with the exception that the split is shown by a plus (+) between the figures, signifying the number of cells in each split; for example, a "B" Strip Type Holder of 8-cell capacity, having a split of 3 cells for one circuit, and 5 cells for another circuit is designated as a "B-3+5"; if for W. E. Co. telephone apparatus "BW-3+5."

The line was primarily designed for standard $2\frac{1}{2} \times 6$ inch Columbia Cartridge Cell Units, but recently, there has been added to the line complete units for $1\frac{1}{2}$ inch cells, the usual height of which is 4 inches. We are also prepared to furnish special Battery Sets taking the following size cells: $\frac{3}{4} \times 2\frac{1}{4}$ inches, $1 \times 2\frac{1}{4}$ inches and $1\frac{1}{4} \times 3\frac{3}{4}$ inches.

Strip Type Model "A"

SERIES STRIP TYPE MODEL "A"

Solid Hard Rubber

These holders are designed for mounting on ceiling, under side of shelf, or any similar place where holders may be screwed up solid. They are furnished with galvanized hinged brackets so that they may be mounted against a side wall. If a split of the Battery Set is desired, provision can be made for this if specified in advance. For every "split" three inches extra width is required. For example, 3 cells may be required for "talking" circuit of an interior telephone system, 5 cells for "ringing" circuit or for annunciator, bells, etc., or a total of 8 cells in the Battery Set. When so specified, any split circuit arrangement can be furnished.

Strip Type Model "B"—Showing Sectional Construction

SERIES STRIP-TYPE MODEL "B"

Skeleton-Hard Rubber Base

These holders are designed for mounting on ceiling, under side of shelf or any similar place where holders may be screwed up solid. They are made sectional unit construction, except the 2 and 3 cell, which are in one piece. Steel mounting straps are furnished with all sectional units, equivalent to the number of units ordered. In ordering sectional units, size mounting irons must be specified. For example, in ordering 100 sectional units, mounting irons equivalent to the number of units ordered, to make up 4-No., 5-No., 6-No., or any size strip holder must be specified.

Holders will be furnished either "knocked down" or assembled; unless otherwise specified they are furnished assembled on mounting irons ready for installation. They are made in all sizes from 2 cell up to any size desired at \$1.50 list per unit.

If a "split-up" of the Battery Set is desired, provision can be made if specified in advance. For every "split" three inches extra width is required. For example, 3 cells may be required for "talking" circuit of an interior telephone system, 5 cells for "ringing" circuit or for annunciator, bells, etc., or a total of 8 cells in the Battery Set. When so specified, this or any "split-circuit" arrangement can be furnished.

PATTERSON BATTERY SETS

Model "BR-4"—Showing Holder Raised to Screw in Cells

Series, Side-Wall Type

MODEL BR

These Outfits, as shown in above cut, are designed for side-wall installations; they consist of a standard Series-Type "B" Strip with the addition of a metal-faced backboard on which stationary binding-post terminals for circuit wires are mounted; on the same base are mounted the knife-switch jaws with which copper blades, carried by Holders, make contact when cells are screwed in and Holder is dropped into place.

Automatic bridge in each cell-receptacle permits the removal of one or more cells from the set without opening the circuit; and also provides a quick test for a weak cell without the use of an ammeter.

In Model "BR" circuit wires once connected to the terminal binding posts never have to be disconnected or reconnected, no matter how many times the battery may be renewed.

These Series-Type Sets should never be used where the current demand is heavy.

"BR" Battery Holders are regularly made in all sizes from 2 cell up to 12 cell—special sizes to order.

If a "split-up" of the Battery Set is desired, provision can be made for this if specified in advance. For every "split" three inches extra width is required. For example, 3 cells may be required for "talking" circuit of an interior telephone system—6 cells for "ringing" circuit or for annunciators, bells, etc.—or a total of 9 cells in the Battery Set. When so specified, this or any "split-circuit" arrangement can be furnished.

Batteries and Accessories

PATTERSON BATTERY SETS

Model "BB-4"

Model "BB-4"

Series, Steel Box-Type

MODEL "BB"

These Outfits consist of the standard "B" Series-Type Strip mounted in a pressed steel case—finished in black japan—with solid bronze padlock and two keys.

They are suitable for all installations where the current requirements are not so heavy as to make desirable the use of the Multiple-Service Outfits.

They have self-locking cases, the front automatically locking under the top flange when pushed up into position.

Stationary Binding-Post Terminals for circuit wires are mounted on backboard of box; on same base are mounted the knife-switch jaws with which copper blades, carried by Holders, make contact when cells are screwed into Holder, automatically dropping into place. Insulated bushings are set-in back for introduction of circuit wires; metal cleats hold box $\frac{1}{2}$ inch from wall, giving ample space for running of circuit wires.

These Sets are regularly made in all sizes from 2 cell up to 12 cell, as listed below; special sizes to order.

If a "split-up" of the Battery Set is desired, provision can be made if specified in advance. For every "split" three inches extra width is required. For example, 3 cells may be required for "talking" circuit of an interior telephone system, 5 cells for "ringing" circuit or for annunciators, bells, etc., or a total of 8 cells in the Battery Set. When so specified, this or any "split-circuit" arrangement can be furnished.

Prices include bronze padlock with two keys.

Solid hard rubber Model "A" Strips in place of skeleton will be furnished when ordered, at an advance of \$1.20 list per cell unit.

*Delivery F. O. B. New York City. For warehouse deliveries write nearest house.
 Batteries and Accessories

PATTERSON BATTERY SETS

Model BSC-6
Flush Steel Cabinet, Door Closed

Model BSC-6
Flush Steel Cabinet, Door Open

Series, Wall-Cabinet Types

MODEL "BSC"

These Battery Sets are designed for the smaller high-class residence, where demands upon the Battery Set are comparatively light. Single-series set will, for this light service, often meet the requirements. They are regularly made in sizes from 3 to 12 cells in flush steel, flush oak, surface steel, and surface oak.

The setting up or renewal of batteries in the above sets is as easy as the renewal of an incandescent lamp and, although done quickly even by an inexperienced person, cannot be done wrong. Circuit wires never have to be disconnected; automatic bridges in each cell-receptacle permit the removal of a cell without opening the circuit. Battery strips themselves are of hard rubber with heavy phosphor-bronze contacts, etc.

Flush sets are particularly recommended for new installations, for the advantage of a flush-setting cabinet can hardly be overestimated.

If a "split-up" of the Battery Set is desired, provision can be made for this if specified in advance. For every "split" three inches extra width is required. For example, 3 cells may be required for "talking" circuit of an interior telephone system, 5 cells for "ringing" circuit or for annunciators, bells, etc., or a total of 8 cells in the Battery Set. When so specified, this or any "split-circuit" arrangement can be furnished.

Standard finish is black enamel for steel sets, dull rubbed varnish for oak sets.

Dimensions given below are "over-all" dimensions of boxes; dimensions of trim in flush steel sets are always 3 inches greater than dimensions of box—1½ inches on each side; dimensions of trim in flush oak sets are always 5 inches greater than dimensions of box—2½ inches on each side. Depth of box in flush sets only 3½ inches.

List Prices and Data

List No.	No. of Bat. in Row	Operative Voltage	Initial Amp. Capacity	*List Price Each			
				Flush Steel	Surface Steel	Flush Oak	Surface Oak
BSC-3.....	3	3	25	\$14.88	\$12.40	\$27.00	\$22.50
BSC-4.....	4	4	25	17.76	14.80	30.96	25.80
BSC-5.....	5	5	25	20.76	17.30	35.16	29.30
BSC-6.....	6	6	25	23.88	19.90	39.60	33.00
BSC-8.....	8	8	25	30.24	25.20	48.96	40.80
BSC-10.....	10	10	25	36.72	30.60	54.36	45.30
BSC-12.....	12	12	25	43.92	36.60	63.72	53.10

In ordering always specify whether surface steel, surface oak, flush steel or flush oak is desired.

Drop-front doors are regularly furnished on extra wide sets.

If double doors are wanted on extra wide sets add 15% to above list prices.

All cabinets are furnished with substantial cylinder locks and two keys.

Standard finish of wood is quartered oak, hand rubbed; of steel, black enamel.

No battery cells included in above prices.

*Delivery F. O. B. New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS

Multiple-Service Battery Sets

These Sets provide a battery power-plant that will do the most severe work—even up to that which has usually heretofore required a motor-generator or Storage Battery Set, at a cost of less than a third for installation and maintenance.

They provide an absolutely positive and easy way of installing a high-amperage Battery Set from which Battery Set every electrical device requiring battery current may be operated in the largest building under the most economical conditions.

All Sets (except Model "BM") have individual circuit-fuses, automatically protecting Battery Set in case of accidental short-circuit, without disturbing operation of apparatus other than on the circuit in trouble.

For Specifying in Advance of Construction, i. e., when Signal Apparatus Is to Be Installed on a New Job

First—To determine the voltage apparatus will require to satisfactorily operate, add to the maximum voltage required by the devices connected to line, sufficient additional voltage necessary to overcome line-resistance for length of circuit used; figure one cell for each volt and select a Battery Set with this number of cells in each row, or next higher. Don't make the mistake of figuring the total number of cells in the cabinet, for the voltage of a Multiple Service Set is the voltage of the cells in a row, not of the total number of cells in cabinet.

Second—To determine the ampere capacity of proper Battery Set, make accurate list of all electrical devices to be operated by the Battery Set, with the number of amperes required at the above determined voltage for the satisfactory operation of each device, adding same up so that you have as a total the maximum number of amperes required for all the apparatus.

For heavy frequently-used installations, multiply the total number of amperes as obtained by the above figuring by 25—this will give the ampere capacity of Multiple Service Battery Set best adapted for long service-life where the drain is frequent and severe; for example, if 2 amperes were required to operate all devices, multiplying $2 \times 25 = 50$, or a 50-ampere set would be the best capacity; if 4 amperes, $4 \times 25 = 100$, or a 100-ampere set; for less heavy and less frequent service, multiply by 20, 15, 10 or even by 5, as careful analysis of service conditions may seem to require.

For Specifying in Advance But After Signal Apparatus Has Been Installed on a New Job

First—Determine the voltage required to satisfactorily operate, by momentarily closing the circuit with all the apparatus in the building operating from a test battery, adding cells if the apparatus does not operate strong enough, taking off cell by cell if the apparatus operates too strong (or shows excessive sparking at contacts). Each cell of battery when circuit is closed and electrical devices are operating will give 1 volt and, therefore, if the installation requires 6 cells to operate satisfactorily from the test battery, select from the tables of the various models listed a Battery Set with a voltage-rating of 6; if 10, select a voltage-rating of 10, etc.

Second—To determine the ampere capacity Multiple Service Battery Set best suited to specific installation in a new building, where no service-life record of an old-style Battery Set is available, for heavy frequently-used installations, it is a safe rule to select a set with a capacity of 25 times the maximum amperes required to operate, but for less heavy and less frequently used installations, multiply by 20, 15 or even by 5, as careful analysis of service conditions may seem to require; the maximum amperes required to operate may be easily ascertained by momentarily closing the circuit and starting all apparatus working from a test battery of the voltage above determined between the terminals of one side, of which battery and one side of the circuit an accurate low-reading ammeter has been cut in; for example: if the ammeter connected as above shows the maximum ampere requirements to be 2 amperes when all apparatus is working, the Multiple Service Battery Set for a heavy frequently-used installation should be 25 times 2, or 50 amperes; if the ammeter shows 3 amperes, the set required should be 25 times 3, or 75 amperes, or, of course, the nearest to this made.

Where a Patterson Battery Set Is to Replace an Old Style Battery

First—To determine the voltage of Multiple Service Battery Set best suited to a specific installation where an old battery has been in, ascertain if the old-style battery, when first installed, operated the apparatus in the building satisfactorily and if so select a Multiple Service Battery Set with the same number of cells per row (not per outfit) as was installed in the old way.

Second—To determine the ampere capacity Multiple Service Patterson Battery Set best suited to a specific installation, where an old battery has been in, and the service-life record is available—figure that a 50-ampere set will operate four times as long as the old-style Battery Set; a 75-ampere set eight times; 100-ampere, 10 times, etc., but always being careful to remember not to figure beyond the limit-life of a Columbia Cartridge-Cell Unit, which is from two to three years; for example: if an old-style Battery Set in a building has given six months' service, and then requires renewal, put in a 50-ampere Multiple Service Set, which will give four times the service-life, and you have approximately the limit-life of the Columbia Cartridge-Cell Unit of two years, and a larger Battery Set would be of no practical advantage; if, however, the service-life of the old-style Battery Set was only three months, the wisest selection of a Multiple Service Outfit would be one that would give a service life of eight times three months, or twenty-four months, the average limit-life of a Columbia Cartridge-Cell Unit.

PATTERSON BATTERY SETS

Multiple-Service Wall-Cabinet Types

SURFACE AND FLUSH TYPES, MODEL "BMC"

The Surface Type "BMC" Outfit is particularly adapted for installation in a finished building. Cabinets are made of polished quartered oak or black enameled steel, the steel cabinets being made in two grades: Grade "A," heavy $\frac{1}{8}$ inch steel with molding. Grade "B," $\frac{1}{4}$ inch sheet steel without molding.

The Flush Type Outfit is adapted for installation in a new building. Cabinet trims are polished quartered oak or black enameled steel, the steel trims being made in two grades: Grade "A," heavy $\frac{1}{8}$ inch steel with molding; Grade "B," $\frac{1}{4}$ inch sheet steel without molding.

Illustrations on opposite page shows clearly the detail of knife-switch jaws on backboard and blades carried by the hard-rubber holder, automatically throwing on to the side bus-bars the voltage and amperage of each row of cells.

These Multiple-Service Sets have individual circuit-fuses, automatically protecting Battery Set in case of accidental short-circuit, without disturbing operation of apparatus other than on the circuit in trouble; ample space is provided at top of cabinet for distribution of circuit wires and a sufficient number of terminal screws are provided, so that never more than one wire need be put under a single screw; each terminal is plainly numbered, so easy reference to various circuit connections can be made by consulting Circuit-Directory Frame on inside of cabinet door.

"BMC" Multiple-Service Cabinets of Surface Type or Flush Type are regularly made and carried in stock from sizes of 2 rows of 3 cells (3 volts, 50 amperes) up to 6 rows of 6 cells (6 volts, 150 amperes).

Surface oak, surface steel, flush oak, flush steel.

Larger sizes will be made to order at short notice and special cabinets with any combination of circuits required, both as to voltage and amperage, will be promptly made to order upon specification as to details.

If a "split-up" of the Battery Set is desired, provision can be made for this if specified in advance. For every "split" three inches extra width is required. For example, 3 cells may be required for "talking" circuit of an interior telephone system, 5 cells for "ringing" circuit or for annunciators, bells, etc., or a total of 8 cells per row in the Battery Set. When so specified, this or any "split-circuit" arrangement can be furnished.

In ordering, always specify whether surface steel or surface oak, flush steel or flush oak is desired.

Drop-front doors will be regularly furnished on extra wide steel sets.

Double doors will be furnished on all oak cabinets.

All steel cabinets are furnished with substantial cylinder locks and two keys.

Standard finish of wood is quartered oak, hand rubbed; of steel, black enamel.

Special cabinets will be made to order at slight advance over regular prices shown above.

Solid hard-rubber Model "A" Strips in place of skeleton will be furnished in above Battery Sets, when so ordered, at an advance of \$1.20 per cell unit.

No battery cells are included in above prices.

*Delivery F. O. B., New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS

Model "BUC-26"

Wall-Cabinet Type Model "BUC"
4-Circuit Reserve Multiple-Service

These sets have a complete reserve battery, which may be thrown into circuit in any emergency. This reserve battery will operate all apparatus in a building which is connected to the battery outfit.

These sets are designed to permit, by simply turning a switch handle and reading dial of the switch, any combination of circuits that could possibly be required for the satisfactory operation of electrical apparatus in a building.

They are made in four types of cabinets: surface oak, surface steel, flush oak, flush steel.

All "BUC" Battery Sets have individual fuses, automatically protecting Battery Sets in case of accidental short-circuit without disturbing operation of apparatus other than on the circuit in trouble; also separate compartment for circuit wire distribution and connections as clearly shown in cut.

See following page for prices.
 Batteries and Accessories

PATTERSON BATTERY SETS

Wall-Cabinet Type, Model "BUC"

4-Circuit Reserve Multiple-Service

Single-Multiple Reserve Outfits, shown on previous pages, have not only the advantage of a complete reserve, available in case of necessity, but have in addition two (2) other "set-ups" which may in an instant be called into service, viz.: "Multiple-Series," "All-Series." These two "set-ups" are in addition to the Reserve feature; the complete range of battery "set-up" is as follows: "Upper Row in Circuit—Lower Row in Reserve," "Lower Row in Circuit—Upper Row in Reserve," "Multiple-Series," "All-Series."

The best connection for economical service in all these outfits is when the dial of the switch reads "Multiple-Series," and it is strongly recommended that the "Upper Row," "Lower Row" and "All-Series" connections be used only in case of emergency.

The "All-Series" connection is most advantageous when the Battery Set has been long neglected and the voltage of the same is down to a point where the electrical devices in a building are not operating satisfactorily; when such a condition exists, the switch should be turned to "All-Series," and with this "set-up" a lot of weak cells all connected together in series will give approximately normal voltage obtainable from the set at "Multiple-Series" when new.

When the "All-Series" connection becomes necessary, a new set of cells should be procured as promptly as possible.

List Prices and Data

TWO-ROW SETS—SINGLE-MULTIPLE RESERVE—WITH CONTROL SWITCH

List No.	No. of Cells	No. of Cells Each Row	Flush Type		Surface Type	
			Flush Steel Grade A	*List Price Each Flush Oak	Surface Steel Grade A	Surface Oak

BUC-35.....	15	5	\$98.00	\$97.56	\$81.66	\$81.30
BUC-36.....	18	6	106.56	106.20	88.80	88.50

"BUC-35" has same combinations as No. "BUC-34," except 5 volts; No. "BUC-36" has same combinations as "BUC-34," except 6 volts.

Battery Sets with circuit combinations to meet special requirements furnished to order.

In ordering, always specify whether surface steel or surface oak, flush steel or flush oak is desired.

No battery cells included in price.

*Delivery F. O. B., New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS

(Patented U. S. and Foreign Countries)

Intercommunicating Telephone Battery Sets

Intercommunicating Telephone installations require a "split-circuit" battery set, usually with 2, 3, 4, or 5 cells for talking, and 4, 5, and 6 or more cells for ringing. While this is a reasonably simple arrangement of circuits, still, in the old way of setting up batteries, a mistake was easily made. In a Patterson Battery Set, the renewal of the entire battery can be done by anybody, yet can only be done in one way, and that the right way, all without the slightest technical knowledge, and without tools.

Patterson Battery Sets, shown on the following pages, have the unique advantage, never possible before with the old-style battery sets, that once the circuit wires to "talking" and "ringing" circuits are connected, no necessity of ever disconnecting them can come up, and the renewal of the battery set is made just as easy as the renewal of a few incandescent lamps.

Inter-phone Patterson Battery Sets "BW-3-4-2," "BRW-3-4-2"

Patterson Battery Sets for W. E. Co. telephone apparatus should always be specified by adding letter "W" after the letters of model number.

"BW-3-4-2," "BSCW-3-4-2," "BMW-23-24-22," "BMRW-23-24-22," and "BMCW-23-24-22," are shown in detail in "Inter-phone and Accessory" Bulletin; they have in addition to "talking" and "ringing" battery combinations, "split" of 2 cells (in Multiple-sets, 4 cells), for operation of door-opener in apartment house work; it is suggested that careful reference to Inter-phone Bulletin be made for detail of Inter-phone Patterson Battery Sets.

The most generally used outfits are the models having 3 cells for "talking" and 5 cells for "ringing." For long lines, outfits with more cells for both "ringing" and "talking" are desirable, and for telephone installations where the use of system is frequent and severe, Multiple-Service Outfits are more economical. The following is a brief summary of Patterson Intercommunicating Telephone Battery Set Models, which are furnished "Series," "Multiple" and "Four-Circuit Reserve."

Series

Model "B-3+5," [W. E. No. "BW-3+5,"] 25-Ampere, without Box.

These and similar outfits are designed for mounting solid on ceiling or underside of shelf.

Model "BR-3+5," [W. E. No. "BRW-3+5,"] 25-Ampere, with Backboard.

These and similar outfits are furnished with backboards, having stationary circuit-wire terminals on the backboard. Illustration shows knife-blade contact arrangement permitting raising of holder for easy renewal of cells.

Model "BR-3+5," [W. E. No. "BRW-3+5,"] 25-Ampere, in Protecting Steel Box.

These and similar outfits are furnished with heavy steel cases for protecting the cells; they have bronze padlocks, and knife-blade contacts back of case, with stationary circuit-wire terminals.

Model "BSC-3+5," [W. E. No. "BSCW-3+5,"] 25-Ampere, in Cabinet.

These and similar models are cabinet outfits and are furnished in four styles of cabinets.

Multiple

"Multiple" outfits furnish 3 to 6 times the service of "Series" sets—4 to 8 times service old-style battery sets.

Model "BM-23+25," [W. E. No. "BMW-23+25,"] 50-Ampere, without Box.

These and similar outfits are designed for mounting solid on ceiling or under-side of shelf.

Model "BMR-23+25," [W. E. No. "BMRW-23+25,"] 50-Ampere, with Backboard.

These and similar outfits are mounted on a backboard with stationary knife-blade terminal contacts. They carry two independent sets of cells for "talking" and two independent set of cells for "ringing," three times the service of single-series sets. Both "talking" and "ringing" sets are protected by plug fuses.

Model "BMC-23+25," [W. E. No. "BMCW-23+25,"] 50-Ampere, in Cabinet.

These and similar outfits carry two sets of cells for "talking" and two independent sets of cells for "ringing," three times the service of single-series sets. Made also 75-ampere, giving six times the service of single-series sets. Both "talking" and "ringing" sets are protected by plug fuses.

Four-Circuit Reserve

Model "BUC-23+25," [W. E. No. "BUCW-23+25,"] 50-Ampere, in Cabinet.

These and similar outfits carry two sets of cells for "talking" and two independent sets of cells for "ringing," giving a complete, independent reserve equipment for both "talking" and "ringing," each protected by plug fuses. By simply turning handle of indicating-switch, the following changes of circuits can be made:

Upper row in circuit both "talking" or "ringing"—lower row in reserve.

Lower row in circuit both "talking" or "ringing"—upper row in reserve.

"Multiple-Series," three times the service of any other way—voltage of one row, but amperage of two rows.

"All-Series," emergency connection—will operate several weeks when possible with no other "set-up."

Model "BUR-23+25," [W. E. No. "BURW-23+25,"] 50-Ampere, with Backboard.

These outfits are similar to Model "BUC-23+25," described above, except that they are mounted on a backboard instead of in cabinet.

NOTE: Four-Circuit Combination Sets are furnished also with three rows of cells both for "ringing" and "talking"; capacity, 75 amperes. For detail of circuits see under "BUC-34."

PATTERSON BATTERY SETS

Series Strip-Type Models "B" and "BR"

Model "B-3+5"

MODEL "B" FOR INTER-PHONE SYSTEMS

These models are the simplest types of series outfits made. Although low in price, they have every electrical advantage of the simple series outfit. They are designed to be mounted solid on ceiling or under-surface of shelf.

Models "BW" for Western Electric inter-phone systems.

Models "B" for other makes Intercommunicating Telephones.

Models "BW" are the same as "B" in every particular, except that they are arranged with "Carbon" of talking battery strapped to "Carbon" of ringing battery—accurately complying with W. E. circuit standards.

List No.	No. Cells Each Row	Operative Voltage		Capacity Amperes	*List Price Each

B-4+6.....	10	4	6	25	15.00

*Add letter "W" after initial letters of model number if set is to be used with W. E. Co. telephone apparatus.

Model "BR-3+5"

MODEL "BR" FOR INTER-PHONE SYSTEMS

These models have backboard so that the whole outfit may be mounted against a side-wall. Illustration shows full detail of the set, and nothing has been omitted to make the Model "BR" one of the best series outfits listed. Stationary terminals for circuit wires are mounted on backboard.

Models "BRW" for Western Electric inter-phone systems.

Models "BR" for other makes Intercommunicating Telephones.

Models "BRW" are the same as "BR" in every particular, except that they are arranged with "Carbon" of talking battery strapped to "Carbon" of ringing battery—accurately complying with W. E. circuit standards.

*Add letter "W" after initial letters of model number if set is to be used with W. E. Co. telephone apparatus.

No battery cells are included in above prices.

Solid hard-rubber Model "A" strips in place of skeleton will be furnished in above Battery Sets, when so ordered, at an advance of \$1.20 list per cell unit.

Larger outfits than listed above will be promptly furnished at proportionate prices.

*Delivery F. O. B., New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS

Series Box-Type, Models "BB" and "BSC"

Model "BB-3+5"

MODEL "BB" FOR INTER-PHONE SYSTEMS

"BB" outfits are provided with a substantial protecting-box of pressed steel, heavily japanned, bronze padlock, two keys, etc. These outfits are the best of the low-priced series models made. Models "BBW" for Western Electric inter-phone systems. Models "BB" for other makes Intercommunicating Telephones. Models "BBW" are the same as "BB" in every particular, except that they are arranged with "Carbon" of talking battery strapped to "Carbon" of ringing battery—accurately complying with W. E. circuit standards.

PATTERSON BATTERY SETS

Multiple-Service Type

Model "BMC-23+25"

MODEL "BMC" FOR INTER-PHONE SYSTEMS

These sets are Multiple-Service Outfits in wall-cabinet form. They are furnished either 50- or 75-ampere capacity. The 50-ampere sets will give four times the service obtainable from the old-style Battery Set, and the 75-ampere, eight times the service.

Models "BMCW" for Western Electric inter-phone systems.

Models "BMC" for other makes Intercommunicating Telephones.

Models "BMCW" are the same as "BMC" in every particular, except that they are arranged with "Carbon" of talking battery strapped to "Carbon" of ringing battery—accurately complying with W. E. circuit standards.

Surface cabinets are particularly adapted to finished building construction, flush cabinets for new building work. Flush cabinets are more desirable if building conditions permit.

Steel cabinets are furnished in two grades, A and B. Always specify which is desired.

Both "talking" and "ringing" circuits are fused, so that in event of accidental short-circuit, the line in trouble will be automatically cut out without disturbing the other circuits or injuring the Battery Set in the slightest.

†Add letter "W" after initial letters of model number if set is to be used with W. E. Co. telephone apparatus.

In ordering, always specify whether surface steel, surface oak, flush steel or flush oak is desired.

Double doors will be furnished on all surface oak cabinets; drop-front doors will be regularly furnished on extra wide steel sets; if double doors are wanted on extra wide steel sets, add 15% to above prices. All cabinets are furnished with substantial cylinder locks and two keys. Standard finish of wood is quartered oak, hand rubbed; of steel, black enamel. Solid hard rubber Model "A" strips in place of skeleton will be furnished, when so ordered, at an advance of \$1.20 list per cell unit.

No battery cells included in above prices.

*Delivery F. O. B. New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS **4-Circuit Reserve, Backboard Type Model "BUR"**

Model "BUR-23+25"

MODEL "BUR" FOR INTER-PHONE SYSTEMS

Model "BUR-23+25" (and similar) Outfits listed below are Four-Circuit Multiple-Service Outfits complete on a backboard for mounting on side-wall. They have two four-circuit switches, one controlling the "talking" circuit and giving four changes of battery "set-up" for the same; the other controlling independently the "ringing" circuit, giving also four changes of battery for that.

Models "BURW" for Western Electric inter-phone systems.

Models "BUR" for other makes Intercommunicating Telephones.

Models "BURW" are the same as "BUR" in every particular, except that they are arranged with "Carbon" of talking battery strapped to "Carbon" of ringing battery—accurately complying with W. E. circuit standards.

The above sets are most advantageously operated with switches at "multiple-series" for both "talking" and "ringing."

Circuits are fused, so in event of accidental short-circuit, the line in trouble will automatically be cut out without disturbing the other line or injuring in the slightest the Battery Set.

These Multiple-Service Outfits will give four times the service for both "talking" and "ringing" that the old-style Battery Set gave, and with the four-circuit switch give a range of battery current that will take care of every emergency requirement of an Intercommunicating Telephone System.

Four-Circuit Outfits will, at slight additional cost, be furnished with 3 rows of cells—a capacity of 75 amperes.

BUR-24+26.....	10	4 or 8	6 or 12	50 or 25	62.20

*Add letter "W" after initial letters of model number if set is to be used with W. E. Co. telephone apparatus.

Solid hard-rubber Model "A" strips in place of skeleton will be furnished, when so ordered, at an advance of \$1.20 list per cell unit.

No battery cells included in above prices.

*Delivery F. O. B. New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS

4-Circuit Reserve Cabinet Type

Model "BUC-23+25"

MODEL "BUC" FOR INTER-PHONE SYSTEMS

Model "BUC-23+25" (and similar) Four-Circuit Multiple-Service Cabinet Battery Sets are the most comprehensive intercommunicating telephone sets imaginable.

Models "BUCW" for Western Electric inter-phone systems.

Models "BUC" for other makes intercommunicating telephones.

Models "BUCW" are the same as "BUC" in every particular, except that they are arranged with "Carbon" of talking battery strapped to "carbon" of ringing battery—accurately complying with W. E. circuit standards.

50-ampere outfits have complete reserve battery for both "ringing" and "talking," and also, by a turn of switch, may be run "multiple-series" or "straight-series," as the conditions of battery may demand.

75-ampere outfits have three reserve sets, or rather, two reserve, beyond the one which may be in service. This applies to both "talking" and "ringing" independently. The 75-ampere sets will, when run "multiple-series," give eight times the service, both "talking" and "ringing," the old-style Battery Set gave.

Above sets are most advantageously operated with switches at "multiple-series" for both "talking" and "ringing."

Circuits are fused, so in event of accidental short-circuit, the line in trouble will automatically be cut out without disturbing the other line or injuring in the slightest the Battery Set.

50-Ampere, Single-Multiple-Reserve Cabinet Sets with 2 Four-Circuit Control Switches

†List No.	No. Cells. Each Row	Operative Voltage		*List Price Each

†Add letter "W" after initial letters of model number if set is to be used with W. E. Co. telephone apparatus.

In ordering, always specify whether surface steel, surface oak, flush steel or flush oak is desired.

Double doors will be furnished on all surface oak cabinets.

Drop-front doors will be regularly furnished on extra wide steel sets; add 15% to list for double doors.

All cabinets are furnished with substantial cylinder locks and two keys.

Standard finish of wood is quartered oak, hand rubbed; of steel, black enamel.

Solid hard rubber Model "A" Strips in place of skeleton will be furnished, when so ordered, at an advance of \$1.20 list per cell unit.

No battery cells included in above prices.

*Delivery F. O. B. New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS
Series Wall-Cabinet Types

Model "BSC-610"

For Telephone Pole-Changer Outfits

A Patterson Battery Set is a necessity for an up-to-date telephone exchange, where Pole-Changer Sets are used; also where large banks of batteries are used for other purposes.

They are regularly made and stocked in 60 and 80 cell capacities.

In large installations of battery cells the screw-top cartridge-cell unit is ideal.

We note below positive points of advantage of a Patterson Battery Set over the old-style battery "set-up" in Pole-Changer Outfits.

1. Loose connections absolutely impossible.
2. Broken wires absolutely impossible.
3. Positive contacts of ample carrying capacity.
4. Automatic bridge in each receptacle permits removal of cell without opening circuit and the "cutting-in" of an additional cell increasing voltage without opening circuit.
5. Entire set may be renewed and circuit never opened during whole operation.
6. Technical care or knowledge in handling Set unnecessary. Cells "cut-in" circuit or "cut-out" as easily as an incandescent lamp.
7. Only two terminals for line, and these on heavy copper plates found at both top and bottom of cabinet.
8. Amperage of individual cells may be tested without removing from holder, and a dead cell may be located without even an ammeter, if required.
9. Main line fuses protect battery set in case of accidental short-circuit.
10. 25 to 40 per cent. longer service than old-style.

Patterson Battery Sets for Pole-Changer installations cost a few dollars more than the old-style battery case with its tangled mass of wires, but completely do away with unnecessary maintenance expense.

List No.	No. of Rows	No. Bat. Each Row	Initial Amperage	Operative Voltage	Approx. Size, In.	Height	Width	Over-All Depth	*List Price Each Pressed Steel	
									Polished Oak	Grade B
BSC-610.....	6	10	25	60	51	36	5 1/4		\$153.60	\$159.48
BSC-810.....	8	10	25	80	65	35	5 1/4		204.80	212.64

In ordering, always specify whether surface steel or surface oak is desired.

Special cabinets will be made to order at slight advance over regular prices.

Separate strips with fittings will be furnished when it is desired to make up own cabinets.

No battery cells are included in above prices.

*Delivery F. O. B., New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS

For Motorboat and Auto Ignition

Boat and Auto Outfit Model "G-6"
 Quartered Oak Cabinet
 Polished Brass Fittings

Automobile Outfit Model "F-6"
 Pressed Steel Cabinet
 Polished Brass Fittings

CABINET MODELS

Patterson Battery Sets are made in forty (40) models for ignition service in the automobile and motorboat field.

In no place where battery is used are the conditions of service harder on a Battery Set than in automobile and motorboat work.

All outfits have emergency-clips on the under-side of hard-rubber plate, so that if a cartridge-cell unit is not available, the old-style binding-post battery may be readily used.

In a Battery Set (for motorboat and auto ignition) a screw-top cartridge battery cell, without wires or binding posts, screws into a solid hard-rubber plate, automatically making all connections. This hard-rubber plate, as shown in cut, forms a solid, substantial, waterproof cover for the battery box, and as all contacts are molded solid into this rubber plate, no possible loosening of connections, bad contacts, or trouble from dampness is possible. Battery cells are suspended from the hard-rubber plate, and do not rest on any surface where dampness can collect.

Each battery receptacle (except Multiple-Series Outfits) has its automatic bridge, permitting removal of an exhausted cell from the holder without interrupting the circuit.

Screw-threaded sockets in plate are renewable if ever necessity requires.

Soft-rubber gasket between plate and box guards effectually the entrance of water or dampness at this point.

Compression-lock-washer thumb-nuts provide means of forcing the hard-rubber plate down onto soft-rubber gasket with such heavy pressure that it cannot jar loose, or let water enter box.

Pressed steel outfits are regularly furnished with back-connected stud terminals and cushion-plungers under each cell, at no extra charge.

OAK CABINETS WITH COVERS—HIGHLY POLISHED

List No.	Double Row No. of Cells Capacity and Arrangement of Circuits	*List Price
		Each
G-6	6 cells, in series, 2 rows of 3	\$20.00
G-12	12 cells, 2 series of 6, 6 cells in each plate	40.00
GM-26	12 cells, 2 rows of 6, 2 sets of 6 cells in Multiple-Series	36.00
G-8	8 cells, in series, 2 rows of 4	25.00
G-16	16 cells, 2 series of 8, 8 cells in each plate	50.00
GM-24	8 cells, 2 rows of 4, 2 sets of 4 cells in Multiple-Series	25.00

Single Row		
GL-4	4 cells, in series, in single row	19.00
GL-6	6 cells, in series, in single row	23.00
	Add for oak cabinets with 2 back stud connections, extra	5.00

PRESSED STEEL CABINETS—BLACK ENAMELED

Double Row		
F-6	6 cells, in series, 2 rows of 3	\$30.00
F-8	8 cells, in series, 2 rows of 4	37.00
FM-24	8 cells, 2 rows of 4, 2 sets of 4 cells in Multiple-Series	37.00
FM-26	12 cells, 2 rows of 6, 2 sets of 6 cells in Multiple-Series	53.00
FM-34	12 cells, 2 rows of 6, 3 sets of 4 cells in Multiple-Series	53.00

No battery cells are included in above prices.

Oak outfits have cushion-plungers under each cell but do not regularly have back-connected studs; same must, for oak outfits, be ordered specially. Price, \$2.50 net extra, per outfit.

Mahogany outfits will be furnished at same price as pressed steel cabinets. In ordering mahogany, designate as E-6, E-12, EM-26, etc.

*Delivery F. O. B., Factory, New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS

"GU-26" Outfit. 2 Sets of 6 Cells

Front View of Hard-Rubber Plate Model "GU-26,"
Showing Four-(4) Circuit-Control Switch

4-Circuit Reserve Models—Cabinet Types

For Motorboat and Automobile Ignition

4-Circuit Reserve Outfits are equipped with special 4-circuit-control rubber-gasketed dial switch, mounted in the center of plate. By means of this circuit-control switch every possible combination which can be used for ignition work is instantly available, and the last ampere of current can be gotten out of cells.

Models "GU-24" and "FU-24," "GU-26" and "FU-26" outfits are double set outfits; they may be run "Multiple-Series," which is best; the left set may be held in reserve, the right set cut into circuit; the right set may be held in reserve and the left set cut into circuit; as a fourth combination, if through long use of the battery, voltage of the set should be down to a point where the engine is missing explosions, switch may be turned "All-Series," which will throw the entire number of cells in straight series, giving, with a lot of weak cells, approximately normal voltage obtainable from four to six new cells. When this emergency connection becomes necessary, the motorist should, as promptly as possible, get a new set of cells.

Models "GU-34" and "FU-34," instead of being a double set of 6, carry 3 sets of 4 cells. These sets should also be run "Multiple-Series" as long as the three sets are of approximately even amperage. Should, however, the amperage of one set of 4's drop down below the others, the low set may be cut out of circuit and running continued on the other two good sets of 4's. "GU-34" and "FU-34" outfits give an approximate initial voltage of 6 and have a higher ampere-hour capacity than a 6-60 storage battery.

QUARTERED OAK CABINETS

Highly Polished

List No.	No. Cells Capacity and Arrangement of Circuits	*List Price Each
GU-24	8 cells in either Multiple-Series, 2-4's, Straight Series, 8, either 4 running, other 4 reserve.	\$32.00
GU-34	12 cells in either Multiple-Series, 3-4's. Right and left set (center set cut out). Center and right set (left set cut out). Center and left set (right set cut out).	43.00
GU-26	12 cells in either Multiple-Series, 2-6's, Straight Series, 12, either 6 running, other 6 reserve.	43.00

Add for oak cabinets with 2 back stud connections, extra net \$2.50.

PRESSED STEEL CABINETS

Enameled Black

List No.	No. Cells Capacity and Arrangement of Circuits	*List Price Each
FU-24	8 cells in either Multiple-Series, 2-4's, Straight Series, 8, either 4 running, other 4 reserve.	\$40.00
FU-34	12 cells in either Multiple-Series, 3-4's. Right and left set (center set cut out). Center and right set (left set cut out). Center and left set (right set cut out).	60.00
FU-26	12 cells in either Multiple-Series, 2-6's, Straight Series, 12, either 6 running, other 6 reserve.	60.00

NOTE: Mahogany outfits will be furnished at same price as pressed steel cabinets. In ordering mahogany, designate as "EU-24," "EU-34" and "EU-26."

Oak outfits have cushion-plungers under each cell, but do not regularly have back-connected studs; same must, for oak outfits, be ordered specially. Price, \$2.50 net extra per outfit.

Pressed steel and mahogany outfits are regularly furnished with back-connected stud terminals and cushion-plungers under each cell, at no extra charge.

No battery cells are included in above prices.

*Delivery F. O. B. New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS

Motorboat Outfit
Model "C-6"

Motorboat Outfit Model "CL-6"
Plate Raised to Screw in Cells

Box Models for Motorboat and Auto Ignition

Cases are made of best grade clear oak, finished on the outside with three (3) coats of spar varnish. Over the entire inside surface of cabinet a heavy seamless layer of Neptune Semi-Rubber Compound is flowed, positively preventing any water whatever reaching the battery cells or interior of box. Box has heavy steel-bound corners, except "D" and "DW." Substantial leather carrying straps are provided.

Each battery receptacle has automatic bridge, permitting the removal of an exhausted cell from the holder without interrupting the circuit.

Screw-threaded sockets in plate may be renewed, if ever necessity requires, by simply removing screws holding re-enforcing plate in position.

Compression lock-washer thumb-nuts, well galvanized, make it possible to force the plate down onto soft-rubber gasket with such pressure that it cannot jar loose.

Emergency-clips are provided so old-style binding-post cell can be used any time Screw-Top Cells are not at hand.

All but "DW" have solid hard-rubber plates, but do not have box covers as Cabinet Types "G" and "GL" do.

Model "D" is a lower-priced outfit similar to Model "C" and has non-renewable zinc sockets, no automatic bridges, no steel corners.

Model "DW" is lowest-priced holder, with oak top in place of hard rubber as in other outfits on this page.

OAK CABINETS—DOUBLE ROW

List No.	No. Cells Capacity and Arrangement of Circuits	*List Price Each
C-6	6 cells, in series, 2 rows of 3	\$17.00
D-6	Same as above, differs slightly in fittings	13.00
DW-6	Same as above, except has oak top in place of hard rubber	10.00
DW-8	Same as above, except 8 cell series	13.00
C-12	12 cells, 2 series of 6, 6 cells in each plate	34.00
D-12	Same as above, differs slightly in fittings	26.00
CM-26	12 cells, 2 rows of 6, 2 sets of 6 cells in Multiple-Series	30.00
C-8	8 cells, in series, 2 rows of 4	20.00
D-8	Same as above, differs slightly in fittings	16.00
C-16	16 cells, 2 series of 8, 8 cells in each plate	40.00
D-16	Same as above, differs slightly in fittings	32.00
CM-24	8 cells, 2 rows of 4, 2 sets of 4 cells in Multiple-Series	20.00
CM-34	12 cells, 2 rows of 6, 3 sets of 4 cells in Multiple-Series	30.00

OAK CABINETS—SINGLE ROW

CL-4	4 cells, in series, in single row	\$15.00
CL-6	6 cells, in series, in single row	19.00
CL-24	8 cells, in single row, 2 terminals on 2 plates, 4 each, plates giving 2 series of 4 or 1 series of 8	30.00

NOTE. When above sets are to be used on automobile, same must be specified to obtain cushion-plunger equipment and the following additions made to prices shown above:

4- to 6-cell outfits, add \$1.00; 8-cell outfits, add \$1.50; 12-cell outfits, add \$2.00; 16-cell outfits, add \$2.50.

No battery cells are included in above prices.

*Delivery F. O. B. New York City. For warehouse deliveries write nearest house.

PATTERSON BATTERY SETS

Model "K-4" Motor Car Outfit
Plate in Position, Batteries Screwed In

Model "K-4" Motor Car Outfit
Case Removed, Cells Screwed In

Motor Car Battery Sets—Model "K"

Motor Car Model "K" is a low-priced model Battery Set, designed specially for use under the seat of a car where space is extremely limited.

Model "K-4" (4-cell outfit) is only $3\frac{1}{4}$ inches wide, $14\frac{3}{4}$ inches long and $8\frac{3}{8}$ inches high, and on account of its small size and extremely compact design can be used on almost any car, no matter how limited the available space for battery is.

Model "K" has the same hard-rubber plate with threaded receptacles on the under side of the plate as other outfits shown in bulletin. Terminal connections to the Battery Set are made by means of large Fahnestock Clips mounted direct on the under side of the hard-rubber plate.

To open the Battery Set, it is only necessary to slip off the two yoke pieces and lift up the box itself. When this is done, the batteries are exposed, and a complete set of new cells may be inserted and the box closed up again within a minute's time. There can be no loose contacts, no broken connections, no trouble from dampness or water; in fact, no battery trouble of any sort where these Model "K" outfits are used under the seat of a car.

All outfits are provided with carrying handles, as shown in illustration.

List No.	No. Cells in Series	Operative Voltage Volts	Initial Amperes	Outside Dimensions Inches	*List Price Each
K-4.....	4	4	25	$14\frac{3}{4} \times 8\frac{3}{8} \times 3\frac{1}{4}$	\$7.50
K-5.....	5	5	25	$17\frac{3}{4} \times 8\frac{3}{8} \times 3\frac{1}{4}$	9.00
K-6.....	6	6	25	$20\frac{3}{4} \times 8\frac{3}{8} \times 3\frac{1}{4}$	11.00

No battery cell included in price.

Screw-Top "Make-and-break" Spark Coils

For Use With Motorboat Outfits "C-8," "D-8" and "G-8"

Model No. 200
Make-and-break Coil

The necessity of keeping spark coils dry and protected from rain and spray is admitted by every boat owner. With these screw-top coils all trouble on this point is avoided.

The coils screw into plate and, when placed in position and plate clamped down on the rubber gasket, both coil and batteries are protected against dampness, spray or even complete immersion under water.

Make-and-break screw-top coils should be used with eight-cell single series outfits.

When coils are purchased at the same time as Battery Holder Cabinets, hard-rubber plates will regularly, without additional charge, be equipped with a third binding post, so that coil may be cut into circuit, independent of battery cells in cabinet. This is extremely desirable where a boat has more than one source of ignition, as coil can then be used with any of them.

List No.	Length Over-all Inches	Diameter Inches	Weight Lbs.	*List Price Each
200	$6\frac{1}{8}$	$2\frac{1}{2}$	$4\frac{1}{4}$	\$10.00

Coil with No. 14 wire, Edison Type Winding.....
*Delivery F. O. B. New York City. For warehouse deliveries write nearest house.

Batteries and Accessories

EDISON PRIMARY BATTERIES

Their Use in Telephone Service

Typical of
EDISON TYPE 202 or 302
 Four Cell Battery in Tray
 Side View

EDISON TYPE 202 or 302
 Four Cell Battery in Tray
 End View

EDISON primary cells are made up in capacities from 150 to 600 ampere hours. They are suitable for circuits in which the flow of current is either continuous or intermittent; there is no deterioration while the battery is idle and no attention required between renewal periods.

Type 202: This cell is made up with a rectangular heat resisting glass jar, porcelain cover and regular 200 ampere hour element, electrolyte and oil. The rectangular jar allows the cells to be assembled compactly in a tray of various units as shown in accompanying illustration, which is furnished for four, five or six cells at a small additional cost. While the Type 202 cells will render good service on any telephone talking circuit, they are particularly suitable for intercommunicating telephone systems, railway way stations and single transmitters generally.

Type 302: This cell is made up with the regular 300 ampere-hour element, electrolyte and oil. The permanent parts are identical with Type 202 cell, excepting that the jar is one-half inch higher than the Type 202 jar. This is the lowest priced 300 ampere-hour cell in glass jar. It is recommended for intercommunicating telephone systems, small private branch exchanges, etc.

The Type 403 cell has a capacity of 400 ampere hours; the jar is porcelain, cylindrical in shape and is furnished with Type 400 element electrolyte and oil. This is the lowest priced 400 ampere hour cell, the jar being less expensive than those furnished with other cells of same capacity, but the current producing material is identical. For telephone transmitter circuits or similar service requiring a comparatively low discharge rate, and where the battery is not exposed to low temperatures the Type 403 is equal in efficiency to any of the 400 ampere hour cells.

The Type 403 cell is recommended for transmitter service in Local Battery Telephone Exchanges, Small Common Battery Telephone Systems, Private Branch Exchanges, Train Dispatchers' Offices, etc., also for Telephone Interrupters or Pole Changers, Supervisory Lamps, Trunk Line Relays, etc.

The Type 502 cell has a capacity of 500 ampere hours; it has a rectangular heat resisting glass jar and Type 500 element, electrolyte and oil. This cell is suitable for the same purposes for which the Type 403 is recommended. The shape of the cell is an item of importance when space is limited. The glass jar makes easy the task of inspecting, and as the approach of exhaustion is indicated by holes appearing in the zincs a convenient method for examining the plates is desirable.

The Type 505 cell has a capacity of 500 ampere hours; it has a round heat resisting glass jar and round cover, but in other respects is identical with the Type 502 cell.

Primary Batteries and Renewals

EDISON TYPE 202

Capacity 200 Ampere-hours

Size over all, $3\frac{1}{2} \times 6 \times 11\frac{3}{4}$. Jar only, inside $2\frac{1}{4} \times 5\frac{1}{4} \times 9\frac{1}{4}$.

Type 202 Cell

EDISON PRIMARY BATTERIES AND RENEWALS

200 HOUR-AMPERE TYPES—CONTINUED

TYPE 206

Size over all, $5\frac{3}{4} \times 9$ inches. Jar only, inside dimension $5 \times 7\frac{1}{2}$ inches.

Type No. 206

List No.	Description	List Price Each
340000	Complete Cell with Porcelain Jar and Hollow Rubber Gasket Ring.	\$4.08
340001	Complete Renewal.	2.56

Renewal Parts

340002	Zinc-Oxide, assembled.	\$2.38
340003	One Can Caustic Soda.28
340004	One Bottle Special Battery Oil.11

Adapted for motor boats. Use five cells for single cylinder; six cells for multiple cylinder, make-and-break engines. Use eight cells for jump-spark.
Cover is fitted with a hollow rubber gasket to prevent splashing.

TYPE 207

Size over all, $5\frac{1}{2} \times 8\frac{3}{4}$ inches. Jar only, inside dimension 5×7 inches.

Type No. 207

List No.	Description	List Price Each
340005	Complete Cell with Enameled Steel Jar and Solid Rubber Gasket Ring. . . .	\$5.28
340006	Complete Renewal.	2.56

Renewal Parts

340002	Zinc-Oxide, assembled.	\$2.38
340003	One Can Caustic Soda.28
340004	One Bottle Special Battery Oil.11

Adapted for motor boats running on fresh water; portable gasoline engines, and other light portable work. Use five cells for single cylinder, make-and-break engines; six cells for multiple cylinder, high speed, make-and-break engines. Use eight cells for jump-spark.

Cells with steel jars are not recommended for use on salt water, because of the corrosive effect of salt air and salt water on the metal jars.

TYPE 208

Size over all, 6×9 inches. Jar only, inside dimension $5 \times 7\frac{1}{2}$ inches. .

Type No. 208

List No.	Description	List Price Each
340007	Complete Cell with Porcelain Jar.	\$3.74

300 Ampere-Hour Types

Type No. 302

TYPE 302

Size over all $3\frac{1}{4} \times 6 \times 12\frac{1}{2}$ inches. Jar only, inside dimension $2\frac{1}{8} \times 5\frac{1}{4} \times 10$ inches.

List No.	Description	List Price Each
340539	Complete cell, with heat resisting glass jar.....	\$5.10
340540	Complete renewal.....	3.06

Renewal Parts

340012	Zinc-oxide, assembled.....	\$2.90
340013	One can Caustic Soda.....	.34
340014	One bottle Special Battery Oil.....	.11

For stationary gas or gasoline engines, burglar alarms, bell systems, program and self-winding clocks, intercommunicating telephone systems, fire alarms, etc.

Type No. 305

TYPE 305

Size over all $6\frac{1}{4} \times 10\frac{1}{4}$ inches. Jar only, inside dimension 6×8 inches.

340009	Complete cell, with porcelain jar.....	\$5.44
340010	Complete cell, with heat resisting glass jar.....	5.78
340011	Complete renewal.....	3.06

Renewal Parts

340012	Zinc-oxide, assembled.....	\$2.90
340013	One can Caustic Soda.....	.34
340014	One bottle Special Battery Oil.....	.11

Adapted for stationary gas or gasoline engines, burglar alarms, bell systems, program and self-winding clocks, intercommunicating telephone systems, auxiliary fire alarm circuits, etc.

TYPE 309

Size over all $5\frac{3}{4} \times 12\frac{3}{4}$ inches. Jar only, inside dimension $5\frac{1}{4} \times 10\frac{1}{4}$ inches.

List No.	Description	List Price Each
340015	Complete cell with porcelain jar.....	\$5.62
340016	Complete renewal.....	3.06

Renewal Parts

340012	Zinc-oxide, assembled.....	\$2.90
340013	One can Caustic Soda.....	.34
340014	One bottle Special Battery Oil.....	.11

Adapted for battery fan motors, small battery motors, program and self-winding clocks, burglar alarms, fire alarms, electro-plating, chemical analysis, and other school work.

Type No. 309

EDISON PRIMARY BATTERIES AND RENEWALS

400 Ampere-hour Types

TYPE 401

Size over all $6\frac{3}{4} \times 12\frac{1}{2}$ inches. Jar only, inside dimension $6 \times 10\frac{1}{2}$ inches.

List No.	Description	List Price Each
340017	Complete cell, with porcelain jar.....	\$6.46
340018	Complete cell, with heat resisting glass jar.....	6.64
340019	Complete renewal.....	3.40

Renewal Parts

340020	Zinc-oxide, assembled.....	\$3.24
340262	One can Caustic Soda.....	.42
340263	One bottle Special Battery Oil.....	.11

For railway signals, crossing bells, battery motors, telephone train dispatcher's talking circuits, etc.

TYPE 402

Size over all $5\frac{3}{8} \times 6\frac{3}{8} \times 12\frac{1}{4}$ inches. Jar only, inside dimension $5 \times 6 \times 10\frac{1}{2}$ inches.

List No.	Description	List Price Each
340265	Complete cell, with heat resisting glass jar.....	\$6.64
340019	Complete renewal.....	3.40

Renewal Parts

340020	Zinc-oxide, assembled.....	\$3.24
340262	One can Caustic Soda.....	.42
340263	One bottle Special Battery Oil.....	.11

TYPE 403

Size over all $7\frac{1}{2} \times 10\frac{3}{4}$ inches. Jar only, inside dimension $6\frac{5}{8} \times 8\frac{3}{4}$ inches.

List No.	Description	List Price Each
340267	Complete cell, with porcelain jar.....	\$6.12
340019	Complete renewal.....	3.40

Renewal Parts

340020	Zinc-oxide, assembled.....	\$3.24
340262	One can Caustic Soda.....	.42
340263	One bottle Special Battery Oil.....	.11

For railway crossing signals, mine signals, fire alarms, burglar alarms, program and self-winding clocks, small common battery telephone exchanges, private branch exchanges, intercommunicating telephones, pole changers, supervisory lamps, trunk line relays, telephone train dispatchers' talking circuits, etc.

TYPE 404

Size over all $7 \times 11\frac{1}{2}$ inches.

List No.	Description	List Price Each
340268	Complete cell, with barrel shape heat resisting glass jar.....	\$6.46
340019	Complete renewal.....	3.40

Renewal Parts

340020	Zinc-oxide.....	\$3.24
340262	One can Caustic Soda.....	.42
340263	One bottle Special Battery Oil.....	.11

Suitable for all purposes for which Types 401 and 403 are recommended. It is more efficient than Type 403 because of better location of plates, and when not exposed to extreme cold is fully as good as Type 401. The jar has greater mechanical strength than glass jars with straight sides.

Type No. 401

Type No. 402

Type No. 403

Type No. 404

EDISON PRIMARY BATTERIES AND RENEWALS
500 Ampere-hour Types

Type 501—Glass
TYPE 501

 Size over all $6\frac{3}{4} \times 12\frac{1}{2}$ inches. Jar only, inside dimensions $6 \times 10\frac{1}{2}$ inches.

List No.	Description	List Price Each
340542	Complete cell, with heat resisting glass jar.....	\$6.98
340543	Complete renewal.....	3.74

Renewal Parts

340544	Zinc-Oxide, assembled.....	\$3.58
340545	One can caustic soda.....	.46
340546	One bottle special battery oil.....	.11

For railway signals, crossing bells, battery motors, telephone train dispatchers' talking circuits, etc.

TYPE 502

 Size over all, $5\frac{3}{8} \times 6\frac{3}{8} \times 12\frac{1}{4}$ inches. Jar only, inside $5 \times 6 \times 10\frac{1}{2}$ inches.

Type 502

List No.	Description	List Price Each
340547	Complete cell, with rectangular heat resisting glass jar.....	\$6.98
340548	Complete renewal.....	3.74

Renewal Parts

340544	Zinc-Oxide, assembled.....	\$3.58
340545	One can caustic soda.....	.46
340546	One bottle special battery oil.....	.11

Recommended for railway signals, crossing bells, battery motors, and especially for talking circuits in dispatchers' offices, for electro-mechanical interlocking plants and for automatic signals.

The advantage of the rectangular jar is that a greater number of cells may be housed in a given space than is possible with round jars.

TYPE 504

 Size over all $7 \times 11\frac{1}{2}$ inches.

Type 504

List No.	Description	List Price Each
340549	Complete cell, with barrel shape heat resisting glass jar.....	\$6.88
340550	Complete renewal.....	3.7

Renewal Parts

340544	Zinc-Oxide.....	\$3.58
340545	One can caustic soda.....	.46
340546	One bottle special battery oil.....	.11

Suitable for all purposes for which type 501 is recommended. It is more efficient because of better location of plates, and when not exposed to extreme cold is fully good as type 501. The jar has greater mechanical strength than glass jars with straight sides.

TYPE 505

 Size over all, $7\frac{1}{2} \times 11\frac{1}{2}$ inches. Jar only, inside $6\frac{3}{4} \times 9\frac{1}{2}$ inches.

R. S. A. SIGNAL CELL

Types 501 and 504 conform to Railway Signal Association Specifications copper-oxide, zinc and soda primary battery, known as RSA Signal Cell.

PRIMARY BATTERIES AND RENEWALS

Edison Cells—Old Types

TYPE BB

Size over all 5 x 9 inches. Jar only, inside dimension $4\frac{1}{4}$ x $7\frac{1}{4}$ inches.

Type BB

List No.	Description	List Price Each
340266	Complete cell, with porcelain jar.....	\$3.40
340275	Complete renewal.....	1.54

Renewal Parts

340276	One Copper-Oxide Plate.....	\$0.68
340277	One double Zinc Plate.....	.68
340278	One can Caustic Soda.....	.26
340279	One bottle Special Battery Oil.....	.08

Adapted for slot machines, small stationary engines, bell circuits, annunciators, intercommunicating telephones, and other low current work. Not designed for portable or marine work as this cell is not liquid tight or splash proof, being intended only for stationary purposes.

TYPE V

Size over all 6 x $8\frac{1}{2}$ inches. Jar only, inside dimension 5 x 7 inches.

Type V

List No.	Description	List Price Each
340281	Complete cell, with enameled steel jar.....	\$5.78
340282	Complete renewal.....	1.88

Renewal Parts

340283	One Copper-Oxide Plate.....	\$0.86
340284	One double Zinc Plate.....	.86
340285	One can Caustic Soda.....	.28
340286	One bottle Special Battery Oil.....	.11

Adapted for motor boats running on fresh water, portable engines, and other light portable work.

TYPE VP

Capacity 150 Ampere-hours

List No.	Description	List Price Each
340287	Complete cell, with porcelain jar.....	\$4.08
340288	Complete renewal.....	1.88

Renewal Parts

340283	One Copper-Oxide Plate.....	\$0.86
340284	One double Zinc Plate.....	.86
340285	One can Caustic Soda.....	.28
340286	One bottle Special Battery Oil.....	.11

Adapted for motor boats running on salt water.

Type VP is the same as Type V except that it is equipped with a porcelain instead of an enameled steel jar.

NOTE: Types 207 and 206 respectively are recommended in preference to Types V or VP because of higher efficiency, greater capacity, lower maintenance cost, and better construction.

Type V Cells, when exhausted, may be converted into Type 207 by securing Type 200 renewals with Type 207 covers and nuts, and discarding the old Type V covers and frames with the exhausted elements.

Type VP Cell may be converted into Type 206 by securing Type 200 renewals with Type 206 covers and nuts.

Type VP

PRIMARY BATTERIES AND RENEWALS

Edison Cells—Old Types

TYPE Q

Size over all, 6 x 9 inches. Jar only, inside dimension 5 x 7½ inches.

Type Q

List No.	Description	Capacity, 150 Ampere-hours	List Price Each
340289	Complete Cell with Porcelain Jar		\$3.74
340290	Complete Renewal		1.70
Renewal Parts			
340291	1 Copper-Oxide Plate		\$0.86
340292	2 Zinc Plates (each \$0.34)		.68
340293	1 can Caustic Soda		.28
340294	1 bottle Special Battery Oil		.11

Adapted for stationary gas and gasoline engines, small motors, burglar alarms, bell systems, mine signals, intercommunicating telephone systems, etc.

Note: Type 208 Cell is recommended in preference to Type Q because of higher efficiency, greater capacity, lower maintenance cost, and better construction.

Type Q Cells, when exhausted, may be converted into Type 208 Cells by securing Type 200 renewals with Type 208 covers and nuts, and discarding the old Type Q covers and frames with the exhausted elements.

TYPE RR

Size over all, 7½ x 10¼ inches. Jar only, inside dimension 6½ x 8¾ inches.

Type RR

List No.	Description	Capacity, 300 Ampere-hours	List Price Each
340295	Complete Cell, with Porcelain Jar		\$5.62
340296	Complete Renewal		2.90
Renewal Parts			
340297	1 Copper-Oxide Plate		\$1.46
340298	2 Zinc Plates (each \$0.60)		1.20
340299	1 can Caustic Soda		.42
340300	1 bottle Special Battery Oil		.11

Adapted for stationary gas engines, railroad crossing signals, mine signals, electroplating, fire alarms, burglar alarms, small common battery and private branch telephone exchanges, intercommunicating telephone systems, telephone interrupters, supervisory lamps, trunk line relays, etc.

Note: Types 403, 302 or 305 are recommended in preference to Type RR, because of higher efficiency, greater capacity, lower maintenance cost and better construction.

Type RR Cells, when exhausted, may be converted into Type 403 Cells by securing Type 400 renewals with Type 403 covers and nuts and discarding the old type RR covers and frames with exhausted elements.

TYPE S

Size over all, 5¼ x 12¼ inches. Jar only, inside dimension 5½ x 10½ inches.

Type S

List No.	Description	Capacity, 300 Ampere-hours	List Price Each
340301	Complete Cell, with Porcelain Jar		\$6.64
340302	Complete Renewal		3.18
Renewal Parts

STANDARD BATTERIES

No. 2

No. 3

No. 2 Samson Battery

Size Over All 8 x 4½ x 4½ Inches

This is regular or circular zinc form of battery. The cell has a voltage of from 1.40 to 1.47, and an amperage on short circuit of from 12 to 16 amperes. This cell is adapted for gas lighting, telephone, gas engines, railway signals, and all special work requiring a battery having great initial strength and capable of quick recovery after hard work.

			Star Fender No. 2.....	200	.10

No. 3 Samson Battery

Size Over All 8½ x 5½ Inches

This style battery has much greater strength and larger current output than the No. 2. It is desirable, therefore, for all purposes where great endurance is needed. The zinc is of very heavy gauge, hand-amalgamated and reinforced. The cover is of polished rubberoid. It is especially adapted for use in telephone installations, switchboard or long distance work. Also recommended for gas engines, railway signals and all extra heavy intermittent battery service.

Batteries and Accessories

BATTERY SUPPLIES

Hydrometer Syringes

An instrument for testing the specific gravity of a liquid without resorting to the tedious and unclean method of pouring the liquid to be tested into a separate vessel. It is also a syringe for filling storage batteries and regulating the quantity of acid above the plates. While this instrument is designed for use in connection with storage batteries, it is as well adapted for testing the fluid of any kind of battery or any bottled or barreled liquid.

The hydrometer syringe consists of a specially designed hydrometer within a glass tube, with a suction bulb at the top and a hard rubber nozzle at the bottom. The hydrometer is free to rise and fall, and indicates the specific gravity of the liquid that has been drawn in the syringe.

Style A—The original and most perfect form with the best quality six-ounce rubber bulb and guiding points on the hydrometer float and buffers at each end to prevent breakage. The hydrometer is graduated in both Baume 10° to 40° and Specific Gravity 1050 to 1400.

Directions for use and comparison of the Baume and Specific Gravity scales are in the cover of the box.

Style A

Style A

List No.		List Price Each
151	Complete in polished oak case, ready to be hung on the wall, with plain hard rubber nozzle and special hard rubber nozzle for filling cells with the proper amount of Electrolyte above the plates and drip cups in bottom of box. Shallow Drop No. 800

Dixie Annunciator Carton

THE DIXIE NO. 81

Schedule "R"

The Dixie Annunciator meets the requirements of all classes of service where a moderate priced annunciator is desired. Each is packed neatly in an individual pasteboard carton with the style and type of contents marked plainly on the label. The glass is enameled, the openings for drops edged with gilt. This annunciator is equipped with Dixie bell. These are not furnished in any special finishes or in other arrangement of drops than given, and are equipped with No. 80 Gravity Drop that is described on preceding page.

GRAVITY DROP ANNUNCIATOR

No. 91

Open View

The San-fer-ann Annunciator

Schedule "R"

The San-fer-ann Annunciator has been produced in a metal case to meet the requirements of architects and engineers who specialize on apartment house work and to satisfy the growing demand for small metal annunciators of simple design and neat appearance.

The San-fer-ann Annunciator is the last word in a high class moderate cost instrument, and in the sanitary standard finish, white enamel with nickel-plated trimming, is an unusually attractive instrument; any discoloration may be instantly removed with a damp cloth. This case is made of steel, drop openings fitted with glass, and is secured to back board with substantial hinges on one side, and locks on other side with screws which fit into keyed slots, a new and very secure form of fastening.

The back board is the usual Edwards type of construction, set wholly inside of the case, the wood grain running in two directions to prevent warping or twisting, at the same time imparting great strength.

The No. 800 Drop is used, resulting in a most substantial and positive acting instrument in which accidental indication is impossible.

A reliable double gong, pivoted armature, adjustable vibrating bell is mounted on the front of case, and is connected to back board by flexible cable; thus bell is also in circuit at time of installation or for test.

Sizes 2 to 12 drops are packed in corrugated paper boxes.

No. of Drops	Arr. of Drops		Width Inches	Outside Dimensions		List Price
	Across	Down		Height Inches	Depth Inches	
2	2	1	7	4 $\frac{3}{4}$	2 $\frac{3}{8}$	\$4.80

*Dimensions given are without trim. For trim, add 2 1/4 inches to height and width.

Finish: Brush brass or other ordinary metal finishes. For wood finishes, add to list 25%.

Bell or buzzer not supplied unless ordered, but is furnished without additional charge when specified.

Intermediate Sizes

For intermediate sizes, deduct \$0.75 per drop from list price of the next larger size listed.

For larger sizes, add per drop \$1.65.

Special Finish, Lettering, Setback and Lamp Signal Attachment

For white enamel finish, add to list:

2 to 12 drop.....	\$4.00	25 to 55 drop.....	\$7.50
13 to 24 drop.....	5.50	56 to 100 drop.....	9.50

Lettering on glass up to 10 letters, list, 65 cents; each additional letter, list, 4 cents.

Electrical setback, up to 20 drops, add to list, \$7.50; over 20 drops, add to list, \$15.00.

Automatic setback up to 20 drops, add to list, \$8.00; over 20 drops, add to list, \$16.00.

With electrical or automatic setback, add to height of case, 1 1/2 inches.

For Lamp Signal Attachment, listed elsewhere, add to list \$4.50.

For special finishes—information on request.

Note: Heavy faced type indicates finish supplied when not otherwise specified.

B - ANNUNCIATOR BELL
C - RETURN CALL BUTTON ON ANNUNCIATOR
D - ANNUNCIATOR DROPS
E - BATTERIES

Wiring Diagram

NO. 10 RETURN CALL ANNUNCIATOR

Schedule "E"

This is the standard return call annunciator. The common battery wire is used for both the call from annunciator and to calling point. One wire, with the common return, is for the call from annunciator, the other wire with same common return is for call to annunciator. This type is generally used in hotels for the purpose of calling the room and to permit a signal to be sent from the room, indicating that the call has been heard or the reverse.

Each annunciator is equipped with a button marked the same as the corresponding drop in the annunciator. The No. 136 combination bell and push is the one generally used, but any three point push and ordinary bell may be substituted if desired.

Wiring Diagram

NO. 114 FIRE ALARM ANNUNCIATOR

Schedule "E"

In case of fire the glass of a fire alarm box is broken causing a tag bearing same number as box to indicate on annunciator, and annunciator bell to ring continuously. Alarm bells are then rung individually, or all at one time, by means of switches on lower part of annunciator.

Simple break glass boxes No. 2240, No. 2241, No. 224 or No. 77 and Recti vibrating or electro-mechanical constant ringing bells are used with this system. The annunciator is equipped with No. 80 lock gravity drop.

SEMAPHORE
LOCK DROP
ANNUNCIATORS

No. 400

No. 400 Unassembled

GENERAL DESCRIPTION

This class of drop has been used for many years in places where the indication is to be electrically restored. The "Edwards" development should more properly be called an invention, for it only retains the principle of a target electrically operated from one position to another. All of the uncertain and super-sensitive balance or magnetic features have been omitted, and there is presented in this drop for the first time a positive, self-locking indication. The action of the drop cannot be affected by vibration, and is capable of taking care of several times the current necessary for operation without injury. The Edwards Lock Semaphore drop (patented) is really the combining of two lock drops in one unit, and does away entirely with the use of permanent magnets. The "position" locking feature of this drop is unique and original. There is nothing flimsy in construction or uncertain in its operation and only the drops that are indicating are in the reset circuit, a big saving in battery life. All iron parts are protected by electroplating, and magnets are wound with enameled wire, making the most substantial and at the same time simple and positive electric control drop that has ever been produced. The usual manual reset found in gravity or needle type annunciators is omitted, control being entirely electrical.

OPERATION

Upon energizing the right hand magnet, the shutter is thrown to the left, after which it may be returned to the first position by energizing the left magnet. The front of the annunciator is clear, as all necessary marking appears on white bristol board cards carried by the drops. The result is a decided improvement in appearance over types exposing all markings upon the face; in addition it affords a convenient means of changing indications at practically no expense or effort.

METHODS OF WIRING RESET BUTTONS

None of these annunciators have the old-fashioned reset plungers in the bottom of the cases. The drops are all electrically reset by an ordinary push button. This makes it possible to locate the reset button away from the annunciator, but if specified on order it can be mounted on the annunciator case.

First: An ordinary push button may be located in any convenient place, and by pushing this button all of the drops that are down in the annunciator will be electrically reset.

Second: One reset button may be provided for each drop in the annunciator so that any drop may be restored without affecting any other. A system of this kind is splendidly adapted for use in hospitals and other places where general supervision of any kind is desired.

Third: The drops of an annunciator may be divided into two or more groups, each group having its own reset button or buttons.

GENERAL

Unless otherwise specified, no push buttons will be supplied with semaphore drop annunciators. If you specify on order that a push button is to be mounted on the annunciator case, regular flush push will be mounted without additional charge. For office installations we recommend the use of the Edwards Directory Push No. 190, and, if the wiring is to be in accordance with plan No. 1 shown below, one of the buttons in this push may be used as the reset button. Complete wiring diagram in the back of every semaphore drop annunciator.

VEHICLE CALL AND SEMAPHORE DROP ANNUNCIATOR

Vehicle Call

No. 413

Vehicle Call

This instrument is designed for use by department stores, theaters, hotels, etc., to enable them to call patrons' vehicles when they are prepared to leave, thus doing away with the old method of shouting numbers, the loss of time and confusion resulting therefrom.

The call is available for both day and night operation. Regularly supplied in plain sheet steel case, finished black, arranged so that, if desired, case to match surrounding trim can be made and placed over it.

It is a silent system, the most efficient and dignified that has yet been produced, and is installed with two or more numbers showing from one or both sides, and with number plates 12 to 18 inches in height.

Indication—The 3-cylinder 2-side call having 125 possible combinations of numbers is the most popular size; indication is by means of six 5-side revolving cylinders arranged three on a side, the figures of which are of white, opal glass—plainly visible by day and illuminated at night by a single incandescent lamp placed inside of each cylinder, the light being so diffused as to render numbers readable for as great a distance as in daylight.

Switchboard

The cylinders are controlled through a small switchboard by means of electro-magnetic clutches indicating and releasing upon the make and break of the circuit. They are geared to operate in pairs, so that each side of instrument will show the same signal. Cylinders are revolved by small motor, which is automatically cut in and out of circuit upon selection of signals, and is in operation only during the actual period of number changes.

Switchboard—Switchboard is a slate box with brass front containing selective switches; also main switch and one for night lights. It is furnished for either flush or surface mounting, as desired.

Prices quoted on application and folder giving size and complete information, with illustrations of actual installations, sent upon request.

18th Century No. 413

Schedule "E"

A hand cabinet case representing the highest art of the skilled mechanic. The greatest attention is given to every detail in order to produce a perfect reproduction of the best available design of the period. A massive, splendidly proportioned case, harmonizing perfectly. Control is entirely electrical and any number of reset buttons may be used. It can be used as a master instrument in multiple with smaller outlying annunciators. The Edwards Lock Semaphore Drop is used and every possible effort has been made to produce the highest class annunciator that it is possible to produce. A beautiful hand polished finish is given in any desired wood. Oak will be supplied unless otherwise specified.

Electrical House Goods and Novelties

BRYANT SILENT CALL SIGNAL SYSTEM

The Bryant Silent Call Signal System is a simplified lamp signal system designed particularly for use in hospitals and having use also in offices, department stores, public buildings, etc.

It requires no relays, no batteries, no motor generators, no transformers, and operates direct on 100 to 125 volts direct or alternating current.

The slightest pressure on the button of a bed push indicates a desire for attendance, which is registered by means of incandescent lamps lighting simultaneously at various points—outside the room or ward door, at the nurse's desk, in the diet kitchen and elsewhere if desired.

The registration of a call may also be indicated to the patient by the means of an illuminated bulls-eye included as a part of the calling station at the bedside. All the signal lamps incident to a given call remain lighted and cannot be changed until reset by the attendant at the calling station by the bedside where the call originated.

A calling station may be confined to the receptacle and cord extension with bed push and control switch, or may include the bullseye and one or more outlets for examination light, reading lamp, fan, heating pad, etc.

The system is permanent positive with minimum maintenance.

For convenience each section of the various stations have been given a letter designation, as shown above the illustration.

BRYANT SILENT CALL SIGNAL SYSTEM

Ward Calling Stations. The ward calling stations are designed for use in rooms where several beds are placed. They are similar to private room calling stations, except that a bulls-eye signal lamp has been added to enable the responding attendant to locate the exact origin of the call. They may also be used in private rooms when it is desired that registration of the call be indicated to the patient. The equipment includes a two candle lamp behind each bulls-eye.

NOTE: When ordering, state finish of fronts. List prices cover white enamel and brush brass. An extra charge will be made for other finishes. Also state markings or numbering desired.

Prices and dimensions of lamp annunciators include candelabra base receptacles and 3/4 inch bullseye, but do not include lamp.

FIRE ALARM SYSTEMS

No. S. S. 1 Panel

DESCRIPTION

Practically all fire alarm systems are either the simple open or closed circuit type.

The Open Circuit System uses current only at the time of ringing bells. It usually consists of simple break glass boxes, such as the Nos. 77, 224, 2241, etc., and vibrating bells such as the Rectil Nos. 100, 1000, 1001, shown elsewhere. To connect up the system three wires are used, one from one side of battery to all alarm boxes, one from the other side of battery to all bells, the third wire is only carried far enough to connect one side of all alarm boxes and one side of all bells to it. (See Diagram No. 1.) Wire not smaller than No. 14 B.&S. copper should be used.

In small systems of 6 to 10 bells, 8 to 10 dry cells connected in series, or the equivalent will be found ample for operation. In larger systems it is desirable in order to prolong life of battery to use twice the number of cells—two series in multiple, or, which is the same thing, parallel.

If a small system is required which will sound a box number, the Nos. 118, 275, 1180 or 1181, shown elsewhere (see illustration with closed circuit system; these boxes are supplied for open or closed at regular price), may be used in place of plain break glass boxes and connected the same way. When one of these boxes is operated the mechanical movement inside makes and breaks the circuit a number of times, thus indicating by a series of short rings the number of the box operated, and this is repeated several times. If in place of vibrating bells user requires single stroke, the Nos. 22, 21 or 21 F.P. bells, shown elsewhere, may be substituted.

This system is used in small hotels, schools, factories, office buildings, etc.

The Closed Circuit System differs from the open circuit in that current is flowing at all times over the wires, and through all apparatus on the lines for the purpose of constant test, so as to be sure that system is in good working order. Should a wire break or a battery fail, there would be an immediate indication by a single stroke on all bells. As an additional signal it is customary to include in alarm line an ordinary relay with vibrating bell of suitable size and about 4 cells of dry battery, so that in event of any failure in the system relay will cause this bell to ring continuously. (See diagram No. 3.)

Boxes usually employed consist of a modified clock mechanism so arranged and adjusted as to open and close the alarm line a given number of times and thus indicate by the number of strokes on bells, the number of the operated box. (See Nos. 118, 275, 1180 and 1181, shown elsewhere.)

Bells of electro-mechanical type are used with these boxes on account of the very small current strength required for their operation. A heavy geared, hand wound mechanism is the medium used to deliver powerful blows on the gong, while current is only used to operate a scientifically designed releasing escapement, self-locking and positive in operation.

Diagram No. 1
Open Circuit Fire Alarm System

FIRE ALARM SYSTEMS

CONTINUED

Diagram No. 2
Closed Circuit Fire Alarm Circuit

Diagram No. 3
Closed Circuit System Including Relay and Trouble Bell

DESCRIPTION

The M. R. 3 Panel was designed for primary battery systems, and by the use of special relays the life of the battery is greatly prolonged. Where in a 300 ampere hour cell, using a discharge rate of 1/10 ampere, it is necessary to recharge once every 125 days, by the use of this panel, life of battery is prolonged to at least three years on one charge.

Systems have been devised to include both the open and closed circuit features—bells on open circuit and boxes on closed circuit—the object being to economize on closed circuit battery investment and maintenance expense. To accomplish this, the use of special relays is required and the success of the system depends on the proper operation of these relays at the time of sounding alarm.

An objection to this system is that it is not known except at the time of operation whether the bells are in operating condition or not, as this portion of system is not under constant test as in the case of the fully closed circuit system, so that where the aim is battery economy, a system employing the M. R. 3 Panel is much superior to the combination system.

Many additions, such as the operation of steam or air whistles, tower bell strikers, lighting of signal lamps, operation of registering devices, etc., can be made to alarm systems by the use of simple relays included in alarm lines, operation of such apparatus being obtained through local battery such as dry cells or equal; so that almost any condition can be met in a very simple manner if requirements are transmitted to the manufacturer.

FIRE ALARM SYSTEMS

CONTINUED

Each time the circuit is opened or closed this escapement permits the striking movement to deliver one stroke, and this may be repeated until spring is run down, usually 350 to 500 strokes. (See Nos. 132-133, 140, 1330, 1331 shown elsewhere.)

The connecting of this system is the most simple of all, as there is only one wire in the circuit. Wire is taken from one side of battery and connected to the nearest bell or box, then carried to the next nearest and so until all have been included; then it is connected to the other side of battery and system is complete. (See Diagram No. 2.) It is not necessary to make any special arrangement of bells or boxes—they may be placed as desired. In other words, bells and boxes may be mixed up at will, the operation is equally satisfactory.

Where operation is to be obtained by battery, any good closed circuit cell, such as the Edison type, will be found satisfactory (the 300 ampere hour size is the one generally selected), or where charging is possible storage battery is recommended. Cells of 24 ampere hour capacity are generally used so that charging is necessary only once a week. In either case it is customary to provide a duplicate set so that one will be in service while the other is being renewed or charged.

Where 110 V. D.C. lighting service is available it may be used in place of battery by the addition of a control panel. These panels, such as the S.S. 1 (single stroke No. 1) for use with systems which include single stroke bells. The E.M. 2 (electro-mechanical No. 2) for use with systems including electro-mechanical bells and the M.R. 3, a special board designed for use where electro-mechanical bell systems are to be operated on primary battery. E.M. 2, S.S. 1, M.R. 3, etc., can be provided to meet the conditions of any system. High voltage service allows the use of single stroke bells, such as the No. 20, 21 and 21 F.P., shown elsewhere, where desired in closed circuit systems. (See illustrations with open circuit system.)

Specially arranged apparatus can be supplied where required to meet specifications issued by fire prevention authorities.

RECORDING SYSTEM

Watchman's Time Detectors

No. 75

Utility: The Edwards' Time Detectors are used extensively in industrial plants, department stores, warehouses, hotels, institutions, yards, docks, steamships, etc., to record accurately and indelibly the exact time of each visit of the watchman at each essential point of his rounds, at which point a station is placed.

Operation: At the station, the watchman is required to insert a special form of key and a perforation is then made by electrical contact, either with the use of a magneto or by means of a battery circuit upon a central dial, the movement of which is operated in connection with an 8-day clock. The dial passes through guides preventing wrinkling, which might cause inaccuracies or interfere with the clock mechanism.

Construction: Metal parts are brass or bronze except where steel is necessary; this is copper plated or japanned. Wire connections are soldered. All connectors are marked to facilitate installation and test. Each instrument is equipped with lock and key and the opening of the door is recorded on the dial. Automatic cutout device is added to battery type to prevent the dial from mutilation through prolonged contact. This is not necessary with the magneto types.

Underwriters' Approval: Edwards' Time Detectors of the magneto type are inspected and approved by the National Board of Fire Underwriters, while battery type systems irrespective of make are without this approval; both types show every deviation from the exact performance of the watchman's duty.

Insurance Rates: The increased measure of security from fire risk obtained through their use has resulted in a substantial reduction in fire insurance rates.

The prices given include a year's supply of dials, but do not include magneto or battery stations.

PROGRAM CLOCKS

The use of the electric program clock is general in colleges, schools, factories and institutions of various sorts to automatically ring groups of bells at prearranged intervals for the changing of classes, shifting of labor gangs, dynamo and furnace changes, cessation and resuming of work, etc.

The operating principle is found in the rotation of a circuit-closing contact arm synchronized with a clock movement. The contact intervals are furnished either changeable at will or fixed and provided for contacts of variable lengths, during which any number of bells of any desired type and style are caused to ring. A switch is provided for hand ringing and for cutting out the program ringing. The clock movement regularly furnished is an 8-day key-winding type of superior construction. Twelve contact keys are furnished. The case is excellently finished oak.

ELECTRIC DOOR OPENERS

Door Openers and Latches

Following will be found a most reliable and complete line of Door Openers and Latches. These have been before the public many years and have proven their worth under most severe conditions of service. They have been made as compact as possible, consistent with rugged construction, in order that they might be available for use under the most varying conditions, and installed at minimum expense. All Door Openers, except Nos. 1541 and 1542, may be used on either right or left-hand doors.

Any Door Opener, except No. 52, can be supplied with a release check, so they may be used where air checks are employed. Price over regular, list \$1.35.

Whitlock Illuminated Porch Number

Illuminated Porch Number

This ingenious device, known as the Whitlock Illuminated Porch Number, consists of an extension globe holder with one side arranged so that a number plate can be inserted.

It is for use on porches. The numbers can be easily read in the daytime as well as at night. To install simply remove the ordinary porch globe and fasten the Whitlock Number on the porch ring by the same thumbscrew that held the glass globe. On the bottom of the number case is a shadeholder with three standard thumbscrews, and the glass globe is fastened to this holder. This arrangement makes the porch lamp serve a double purpose. It lights the Whitlock Porch Number and also lights the porch.

Each number is a stamped metal unit that slips into a slide over an opal glass background.

Any combination of numbers from 0 to 99999 can be obtained. The numbers themselves are approximately $2\frac{3}{4}$ inches high and are large enough so that they can be read without difficulty at considerable distance either during the day or at night.

List No.	List Price Each
361943 Whitlock Illuminated Porch Number.....	\$4.00

A standard package consists of 24 Whitlock Porch Numbers, 96 assorted numerals, with an assortment of blanks for filling unused number spaces.

BURGLAR ALARM APPARATUS

GENERAL DESCRIPTION

This apparatus is manufactured for entire protection against intrusion of any sort, and it includes complete equipment necessary for installation with the exception of wire and battery. It comprises burglar alarm annunciators, alarm bells, window, door, shade, transom, shutter and scuttle springs, switches and automatic house-lighting devices. The interchangeability of these devices permits unlimited flexibility for the system; it will be found invaluable for private houses and apartments, suburban homes, institutions, poultry farms, large estates, stores, etc.

OPERATION

At a given time the system is placed in effect, either wholly or in part, by the arrangement of switches at the annunciator. A silent test switch assures the user that all desired openings are under protection. There is also a switch to test bell and line; and one to test battery and line. If now, an entrance is attempted, a bell rings at any desired point and the point of entrance is indicated. Additional bells or any form of signals or indication may be added to the equipment, to be placed at any point on the premises or at a remote point, or the instrument may be so arranged as to cause the entire house or individual lights, either gas or electric, to become illuminated when an alarm is given, or all of these features may be included.

Certain sections, such as coal chute, wine cellar or scuttle, may be left permanently connected by placing switches for these sections on the upper, or day, bar. Selected portions, such as the servants' quarters and other parts of the house to be used before the family arises, may be automatically disconnected upon the ringing of a servants' call by placing the switches for those sections on the lower, or night, bar.

Correspondence regarding special usage of burglar alarm application is invited.

CONSTRUCTION

These instruments are of standard construction and design, as described elsewhere. In such styles as call for them, high grade clock movements are installed. Switch bars for night and day connection and testing circuits are included. Alarm bells recommended are the Recti and the Lungen. See also constant ringing attachments, small bells, and entrance door springs, lock switches, etc.

EXTRA ATTACHMENTS

Schedule "E"

For No. 3, No. 4, or No. 5 Burglar Alarms.	*List Price
Automatic gas lighter, one or two burners.	\$11.50
Automatic gas lighter, more than two burners, per burner.	2.50

CLOSED CIRCUIT DROP NO. 11

Schedule "E"

For annunciators or burglar alarms on closed circuit, each drop acting as its own relay.

Add to list price of burglar alarm:

	*List Price	
	With Clock	Without Clock
For 6-section cases.....	\$72.50	\$35.00
For 8-section cases.....	87.50	50.00
For 10-section cases.....	102.50	65.00

For larger sizes, prices furnished on application.

For annunciators all styles except fire alarm, return call or the No. 81, add to list price, \$5.00 per drop.

No. 95

No. 95B

TRAILER NO. 96

Schedule "E"

A spring operated clock movement causes arm to rotate, closing contact by means of brush at end of arm wiping over the points in succession. It is used when a number of bells are to be operated, so

that battery economy may be effected or where needed current for proper operation of all bells at once would be so high as to be inadvisable. It can be supplied for any number of circuits.

List No.	*List Price Each	
	2 to 6 points.....	\$22.50
96	Extra points, add to list, for each point, \$1.00.	

LOCK BURGLAR ALARM SWITCHES

Schedule "E"

The No. 95 switch is placed on the outside of door frame, so that when burglar alarm is set, persons having a key may enter without giving the alarm.

95 Polished brass or nickel..... \$6.00

The No. 95A operates the same as No. 95, but has two locks. Keys fit both inside and outside locks so that after switch has been turned off outside, key can be withdrawn and person entering can close the door, insert key on inside and reset switch.

95A Polished brass or nickel plate..... \$12.00

The No. 95B is the same as No. 95, but with rod to go through door frame, fastened by nuts on inside, so that it cannot be removed from the outside.

95B Polished brass or nickel..... \$4.20

*Delivery F. O. B. Factory, New York City. For warehouse deliveries write nearest house.

BURGLAR ALARM ACCESSORIES

Open and Closed Circuit Springs

Open Circuit Window Springs: Nosing in normal position, contact is broken.
 Closed Circuit Window Springs: Nosing in normal position, contact is established.
 Door Springs are just the reverse.

Note: In installing window springs, one should be placed in the frame several inches above the lower end of the upper sash, and one a similar distance below the upper end of the lower sash. Each sash should be mortised so the nosing will set in the recess when the window is closed, and this mortise should be continued above the upper, and below the lower spring a few inches to permit the opening of the window for ventilation. When the sash is moved beyond that point, it depresses the nosing, making or breaking (as the system is open or closed circuit) the circuit.

Where the sash is loose, the use of the No. 121 counter spring mounted on the side of the frame opposite to the window spring will insure satisfactory results.

All spiral and contact springs are phosphor bronze metal. The contacts are rubbing or scraping.

Electrical House Goods and Novelties

FIRE ALARM BOXES
SELECTIVE RINGING TYPES

No. 1181

No. 1275

No. 118

No. 227

No. 129 Weatherproof Case
for Fire Alarm Boxes

Local Non-interference

These boxes are used in systems where it is desired to signal a number to show location of fire, and having been started in motion cannot be interfered with by manipulation of the starting device until complete set of signals has been sent.

They consist of a mechanical movement, which, when started in operation, opens and closes (or vice versa) alarm circuit the proper number of times to announce by a series of single strokes on alarm apparatus the number of box operated.

NO. 1181 BREAK GLASS TYPE

Schedule "R"

This is designed to meet the requirements of recent fire prevention laws. It is substantial in construction, reliable in operation and includes a silent test of mechanism as well as an alarm test. This box is arranged for four rounds; after the glass is broken it cannot be replaced until the box is rewound and set for another alarm. The mechanism is entirely insulated from the case, and contact is of the scraping self-cleaning type.

It is arranged for use with surface conduit installation and drilled and tapped for $\frac{1}{2}$ inch conduit.

The 1180 box is the same as No. 1181, except that it is arranged for concealed conduit installation.

Finish red enamel, raised lettering finished white. Prices include hammer and chain.

List No.		*List Price
1180	Break glass type for concealed conduit installation.....	\$25.00
1181	Break glass type for surface conduit installation.....	25.00

NO. 1275 PULL LEVER TYPE

Schedule "R"

Designed to meet requirements of recent fire prevention laws. For use with surface conduit. Selective ringing. Lever having been pulled, it is automatically disengaged and cannot interfere with proper operation of box through additional pulling. When signals have been completed, lever is automatically re-engaged and box is ready for another alarm. No winding ever necessary. Separable conduit fitting drilled and tapped top and bottom for $\frac{1}{2}$ inch conduit ($\frac{3}{4}$ inch if desired) so that conduit work may be completed and wire pulled in and connected up. Boxes may be attached at any time by machine screws supplied with them. No. 1276 semi-flush same as No. 1275, but arranged for use with concealed conduit. Conduit box included in price.

TWO CIRCUIT SERVICE

The Nos. 1275 or 1276 can be furnished arranged so that ordinary pulling of the box will cause only two or three bells at central points to ring. By inserting special key and pulling box all bells may be rung. Where this style box is desired add the letter "S" to box number.

Nos. 1275 or 1276.....	\$17.00
Nos. 1275S or 1276S.....	25.00

NO. 118 BREAK GLASS TYPE

Schedule "E"

Slow movement. Furnished to repeat signal three or six times, as ordered.

Finish, red enamel. Case, size, 6 x 4 $\frac{1}{4}$ x 3 inches.

118	Break glass to turn in alarm.....	\$15.00
118A	Pull lever to turn in alarm.....	15.00

NO. 227 BREAK GLASS AND PUSH BUTTON TYPE

Schedule "E"

Furnished to repeat signal three times. Weatherproof case with conduit entrance at bottom; hinged door and brass padlock. Case is japanned finish. Size, 9 x 5 $\frac{1}{4}$ x 4 inches. Finish, red enamel.

227	Break glass and push button to turn in alarm (weatherproof).....	\$35.00
-----	--	---------

NO. 129 WEATERPROOF CASE

Schedule "E"

Cast iron, japanned finish enclosing case.

Provided with lock or thumb latch, as desired. Intended chiefly for No. 118 fire alarm boxes; size of case, 8 $\frac{1}{2}$ x 7 $\frac{1}{2}$ x 4 inches. Strap key for return signals for test may be included.

129	Weatherproof enclosing case.....	\$10.00
	Extra charge for strap keys, each.....	1.50
	Glass panel in door, extra each.....	1.90

*Delivery F. O. B. Factory, New York City. For warehouse deliveries write nearest house.

FIRE ALARM BOXES

No. 224

No. 2240

No. 2241

Break Glass, Contact Making Types

Schedule "E"

These boxes are used where a general alarm on alarm apparatus such as vibrating bells of Recti type is desired, or in centrally controlled systems, where annunciators such as the No. 114—which is equipped with bell control switches—and vibrating alarm bells are employed. In this latter system, the operation of a box causes tag bearing number of the box operated to indicate on annunciator, and annunciator bell to ring continuously. It is then possible for person at annunciator to ring any or all alarm bells to clear building. In using this type of apparatus, open circuit system is usually employed.

A very high degree of perfection has been obtained by close attention to details of manufacture. Prices include hammer and chain.

NO. 224 FLUSH TYPE

Schedule "E"

Breaking glass closes circuit. Size plate, $3\frac{1}{8} \times 4\frac{3}{8}$ inches. Fits standard switch box.

Standard finish: Dark mat ground, raised lettering and borders brush brass or bronze.

List No. Mfr. No.

*List Price

360270	224	Fire Alarm Box, Flush type.....	\$3.35
--------	-----	---------------------------------	--------

NO. 224A SURFACE TYPE

Schedule "E"

Same as No. 224, except made for surface mounting.

Operation: Breaking glass closes circuit. Size, overall dimensions, including mat, $4\frac{1}{8} \times 5\frac{1}{4}$ inches.

Standard finish: Dark mat ground, raised lettering and borders brush brass or bronze.

List No. Mfr. No.

*List Price

360271	224A	Fire Alarm Box, Surface type.....	\$3.75
		Mat only for 224A.....	1.00

Special Note: Boxes No. 224 and No. 224A have heavy cast brass faces; clear glass in front, is backed by red plate; contacts are so designed as to be positive in operation, irrespective of length of time they have been inactive. Special test key included with box; signaling without this key or by breaking glass impossible.

NO. 2240 CONCEALED CONDUIT TYPE

Schedule "E"

This box fits a standard push button switch box. The contacts are of a new positive acting design. Raised letters finished in white are cast on the front. The box is finished in red enamel.

Test may be made by unlocking and opening the hinged front of the box, which accomplishes the same result as if the glass were broken, in that it allows the operation of the regular contact mechanism. Contact springs are heavy phosphor bronze, and when box is operated the heavy disk makes a positive scraping contact.

List No. Mfr. No.

*List Price

360273	2240	Flush conduit type.....	\$6.00
--------	------	-------------------------	--------

NO. 2241 SURFACE CONDUIT TYPE

Schedule "E"

The No. 2241 is the same as the No. 2240, except that a back case has been added to adapt it to use with surface conduit installations. The case is drilled and tapped for $\frac{1}{2}$ inch conduit.

List No. Mfr. No.

*List Price

360274	2241	Surface conduit type.....	\$7.00

FIRE ALARM APPARATUS

No. 229

No. 238

Central Station Contact Box

NO. 229

Schedule "E"

This instrument consists of a mechanical movement somewhat similar to that installed in the standard fire alarm box. Also a series of brass wheels marked with the numbers which they sound, mounted individually on pins in the case. Case is quartered oak, with glass door supplied with lock and key. This instrument is used for village or town fire alarm systems, for the operation of tower bells, or it is located at fire headquarters, so that any box number may be rung from that point.

It is also available for use in connection with factory signal systems, for the calling of company officers, superintendent, foreman, etc., by sounding numbers of each on single stroke or vibrating bells.

To operate number, wheel bearing proper number is placed on shaft of mechanism, after which the pulling of lever starts it in motion, automatically sounding number of district in which fire is located, or if used for individual signal the number of person it is desired to reach.

Mechanism can be arranged to sound this number 3 or 6 times as may be desired.

List No.	Mfr. No.	Description	*List Price Each
360535	229	Box including 6 number wheels	\$45.00
360536		Extra number wheels	2.00

Fire Alarm Relay

NO. 238

Schedule "E"

Base polished mahogany, metal parts, old brass. Specified with Edwards' Factory or Town Fire Alarm System, with electro-mechanical gongs when used on separate circuits, or any extension work.

List No.	Mfr. No.	Resistance	*List Price
360280	238	20 ohms	\$3.00
360281	238	50 ohms	8.75
260282	238	100 ohms	9.50
260283	238	250 ohms	10.50

No. 2197

No. 5985

Automatic Pen Register

NO. 2197

Schedule "E"

Self-starting and self-stopping. Registers in ink the number of the fire alarm box (by means of short dashes on paper tape) from which call is made. Standard resistance unless otherwise specified, 20 ohms. Other resistances special.

List No.	Mfr. No.	Resistance	Std.	*List Price
360284	2197	Single pen	20 ohms	\$125.00
360285	2197	Double pen	20 ohms	140.00

Automatic Paper Winder

NO. 5985

Schedule "E"

360286 5985 Paper Winder. Japanned finish; operates in connection with either type of pen register. *Delivery F. O. B. Factory, New York City. For warehouse deliveries write nearest house.

TOWER BELL STRIKERS

ALTERNATING OR DIRECT CURRENT

No. 127

Showing manner of connection
to tolling hammerShowing position of
stroke on bell

Tower Bell Strikers

NO. 127

Schedule "E"

This apparatus is used to automatically sound fire or general alarms on large bells. It is also available for sounding time or service periods on church bells and can be so installed that it does not in any way interfere with the regular hand tolling hammer.

It is regularly wound to a resistance of 25 ohms for battery operation, but will be furnished for service on direct current up to 600 volts or alternating current 100 to 250 volts, 25 or 60 cycles single phase without additional charge. Where used in connection with fire alarm systems, high voltage may be used for operation of striker only by the introduction of a relay, this being necessary as alarm boxes are not designed to take care of high voltages. Always specify, however, if for open or closed circuit service.

Capacity of striker, about 100 blows at one winding. Weights drop about six inches for each stroke of hammer. From 50 to 75 pounds, depending on size of bell, are required for operation.

This apparatus is well adapted for town or village fire alarm systems, and the Nos. 1180-1181 and 1118 boxes are recommended for use with it.

List No.	Mfr. No.		*List Price
360258	127	For bells up to 2000 lbs. Hand winding.....	\$350.00
360259	127A	For bells up to 3000 lbs. Hand winding.....	400.00

In ordering always state frequency as well as voltage of operating current.

Price includes cable for weights but not the weights.

*Delivery F. O. B. Factory, New York City. For warehouse deliveries write nearest house.

EDWARDS SPECIALTIES

Solenoid Striker

Schedule "E"

For Striking Electrically, Tower, Fire or General Alarm Bells

Where current is available for operation, the solenoid striker is sometimes preferred to mechanical type as the necessity for winding is entirely done away with.

Strikers can be supplied in various sizes for operation on direct current up to 250 volts, and prices quoted include multiple carbon contact relays which are necessary to take care of sparking due to solenoid discharge at the moment of breaking the circuit.

It is possible by means of a small line relay to connect these strikers directly with the fire alarm line so that the number of any box operated would be sounded on the large bell.

The device is an attractive one for attaching to church bells, as tolling can then be accomplished by means of an ordinary push button.

No. 141

List No.	Description	*List Price Each
141	For bells weighing up to 1000 lbs.	\$300.00
141A	For bells weighing up to 2000 lbs.	400.00

When not otherwise specified, solenoid strikers will be arranged for operation on 110 volts D.C.

Dixie No. 207

Cadet No. 208

"Dixie" and "Cadet" Transformers

GENERAL DESCRIPTION

Schedule "E"

Edwards' bell-ringing transformers are self-contained units, encased in japanned iron, for operating small bells, annunciators, door openers, etc., from alternating lighting circuits, avoiding expense and annoyance incidental to the use of batteries, and eliminating any danger that might occur from the use of higher voltages. Lugs in the case accommodate heavy screws for holding the transformer in place. Flexible leads provide for connection to the lighting circuit. Vise grip binding posts are provided for the bell side, plainly marked, making mistakes in connecting impossible and preventing accidental disconnection of the wires.

Every precaution has been taken to make Edwards' transformers reliable and practicable. There are no moving parts; the windings, and laminated core of highly efficient non-aging steel, are entirely enclosed. The insulation is so effective that a direct short circuit on the bell side will not injure the system or the bell-ringer, and the rise in temperature in the ringer is much less than 50 degrees C. The bell-ringer is indestructible and economical, the first cost being a little more than that of a set of good batteries and the instrument requires no adjustment. Each transformer is thoroughly tested—and well packed in corrugated pasteboard boxes.

List No.	Type	Capacity	Current Frequency	Std. Pkg.	*List Price Each
207	Dixie	8V.	25 or 60 cy. 100-125 V.	6	\$5.40
208	Cadet	6, 12 or 18 V.	25 or 60 cy. 100-125 V.	6	8.10

Assortment permitted to make standard package.

Approved by The National Board of Fire Underwriters.

*Delivery F. O. B. Factory, New York City. For warehouse deliveries write nearest house.

IRON BOX BELLS AND BUZZERS
 DIRECT CURRENT

No. 1845

No. 1855

No. 1848

No. 1900

Western Electric
Iron Box Bells and Buzzers
 Class "B" Adjustable

This Bell is guaranteed to give satisfaction.

Every part is designed for long and hard service with the possibility of a "ground" or "short circuit" in the bell practically eliminated. Specially formed hard fiber in addition to rubber covering is used to prevent circuit wires coming in contact with the bell frame. The base or back of the bell is made from dead soft steel formed under heavy pressure and arranged with a continuous rim which rests flush on the surface to which the bell is attached, preventing anything getting into the bell mechanism. The armature and magnets are mounted on a separate base which is securely attached to the back. The armature striker rod and ball are made from one piece of metal, therefore, no chance of any parts becoming loose. The armature is pivoted and fitted with an adjustable tension spring which can be adjusted for one to eight cells of battery. The contact post is non-turnable and fitted with a lock nut on the contact screw. The binding posts are non-turnable. Magnet cores are tipped with copper caps to prevent armature from sticking. The cap and frame are protected with a covering of black japan and all other parts are nickel and copper plated to prevent rusting.

List No.		List Price
1855	Class "B" Adjustable Iron Box Bell, 2½ inch gong.....	\$0.54
1856	Class "B" Adjustable Iron Box Bell, 3 inch gong.....	.56
1857	Class "B" Adjustable Iron Box Bell, 4 inch gong.....	.70
1858	Class "B" Adjustable Iron Box Buzzer.....	.52

Class "C" Non-Adjustable

The cover is made of tinned sheet steel, black japanned, and is held rigidly in place by metal projections on top of base, under which the cap is snapped.

The base is of heavy annealed steel, black japanned. Contact post is attached to the magnet head which insures permanent adjustment and no danger of a "ground" on the base as it does not touch it.

The armature, striking rod and ball are all made from one piece of metal—a sure prevention of loose striker rods or balls.

Magnets are standard size and end of upper magnet is fitted with a copper cap to prevent armature sticking.

Binding posts are non-turnable, which prevent holding screws from turning and making loose contact. Every detail of the bell and buzzer is constructed for durability and satisfactory service.

One cell of battery will operate either, and as many as five cells can be used if desired.

List No.		List Price

SIGNAL GONGS

ALTERNATING OR DIRECT CURRENT

No. 132
Interior Gong

No. 133
Weatherproof Gong

No. 133
Full Grid

Electro-Mechanical Bells

GENERAL DESCRIPTION

These bells are dust, insect, moisture and weatherproof, or non-weatherproof if for interior use. The method of operation is: The hammer upon being released makes a full revolution, passing under the gong to an inclined plane, where it is raised and permitted to strike the gong with great force gathered in the revolution. The recoil causes it to drop and become locked in its normal position under the gong. As the full force of the blow is spent on the gong, there is no strain on the mechanism. The operation, through an eccentric, produces positive action and requires but a small amount of current. Either open or closed circuit, and can be arranged to operate as a single stroke or constant ringing gong, or to ring continuously until run down upon make or break of circuit. It can also be arranged to operate on 110 volt A.C. or D.C. circuit.

INTERIOR TYPE NO. 132—5 OHMS

Polished hardwood case, nickel plated front. Can be arranged to operate as single stroke, constant or continuous ringing, until run down, on either open or closed circuit. Capacity, 200 blows to each winding.

List No.		Sizes Inches	*List Price
132	Interior type	4	\$20.00
132	Interior type	5	22.00
132	Interior type	6	23.00
132	Interior type	8	25.00
132	Interior type	9	27.50
	Extra keys		.40

WEATHERPROOF NO. 133—5 OHMS

Red enamel for fire alarm purposes, but can be furnished in black.

Resistance up to 10 ohms furnished without extra charge. Capacity, 350 blows to each winding.

Either open or closed circuit, and can be arranged to operate as a single stroke or constant ringing gong or to ring continuously until run down.

List No.		Sizes Inches	*List Price
133	Weatherproof type	6	\$33.00
133	Weatherproof type	8	35.00
133	Weatherproof type	10	37.50
133	Weatherproof type	12	40.00
133	Weatherproof type	14	45.00

CONDUIT BELLS—NO. 1330-1331—5 OHMS

*No. 1330 Bell for Use With Concealed Conduit

No. 1331 Bell for Use With Surface Conduit

Schedule "R"

This is a recent design which permits of operation on exceedingly small current flow. The mechanism is entirely insulated from the case. Connectors for line wires are at side in conduit box where they are most accessible, as the entire upper half of conduit box may be removed by taking out two screws. It is ordinarily furnished with one opening for $\frac{1}{2}$ inch conduit, but can be supplied with opening for $\frac{1}{2}$ inch or $\frac{3}{4}$ inch conduit on back or with two in sides of conduit box. Capacity, 350 blows to each winding.

List No.	Sizes Inches	*List Price
1331	8	\$36.20
1331	10	38.50
1331	12	40.80
1331	14	45.40
1331	15	50.00
1331	16	54.00
1331	18	61.50

In ordering always specify voltage of operating current.

Standard finish, red enamel. Black enamel can be furnished if specified. For concealed conduit special box is required which is furnished without extra charge. Resistance up to 40 ohms furnished without extra charge.

*Note: In ordering concealed type add Letter "C" to list number.

INTERIOR TYPE NO. 140—5 OHMS

Schedule "E"

For either open or closed circuit, and can be arranged to operate as a single stroke or constant ringing gong, or to ring continuously until run down. Capacity, 350 blows for each winding.

List No.	Sizes Inches	*List Price
140	6	\$38.00
140	8	40.00
140	10	42.50
140	12	47.50
140	14	50.00
140	15	56.00
140	16	60.00
140	18	72.50
Extra key		2.00

In ordering always specify voltage of operating current.

For special resistance on the above, see table of additions on special page that follows; however, resistance up to 10 ohms furnished without extra charge.

Polished oak case.

Above bells can be equipped with attachment for ringing a small vibrating bell or buzzer to indicate need of winding. Prices for attachment only, list \$6.25.

*Delivery F. O. B. Factory, New York City. For warehouse deliveries write nearest house.
